

Benchmarks, accelerated datacenters, parallel language standards, and regular software testing at scale

Jack Wells

Science Program Manager, NVIDIA

Challenge: Scientifically Faithful & Sustainable Benchmarks

Benchmarks should be developed that are faithful to modern science applications and workflows.

Opportunity for more open development of benchmarks

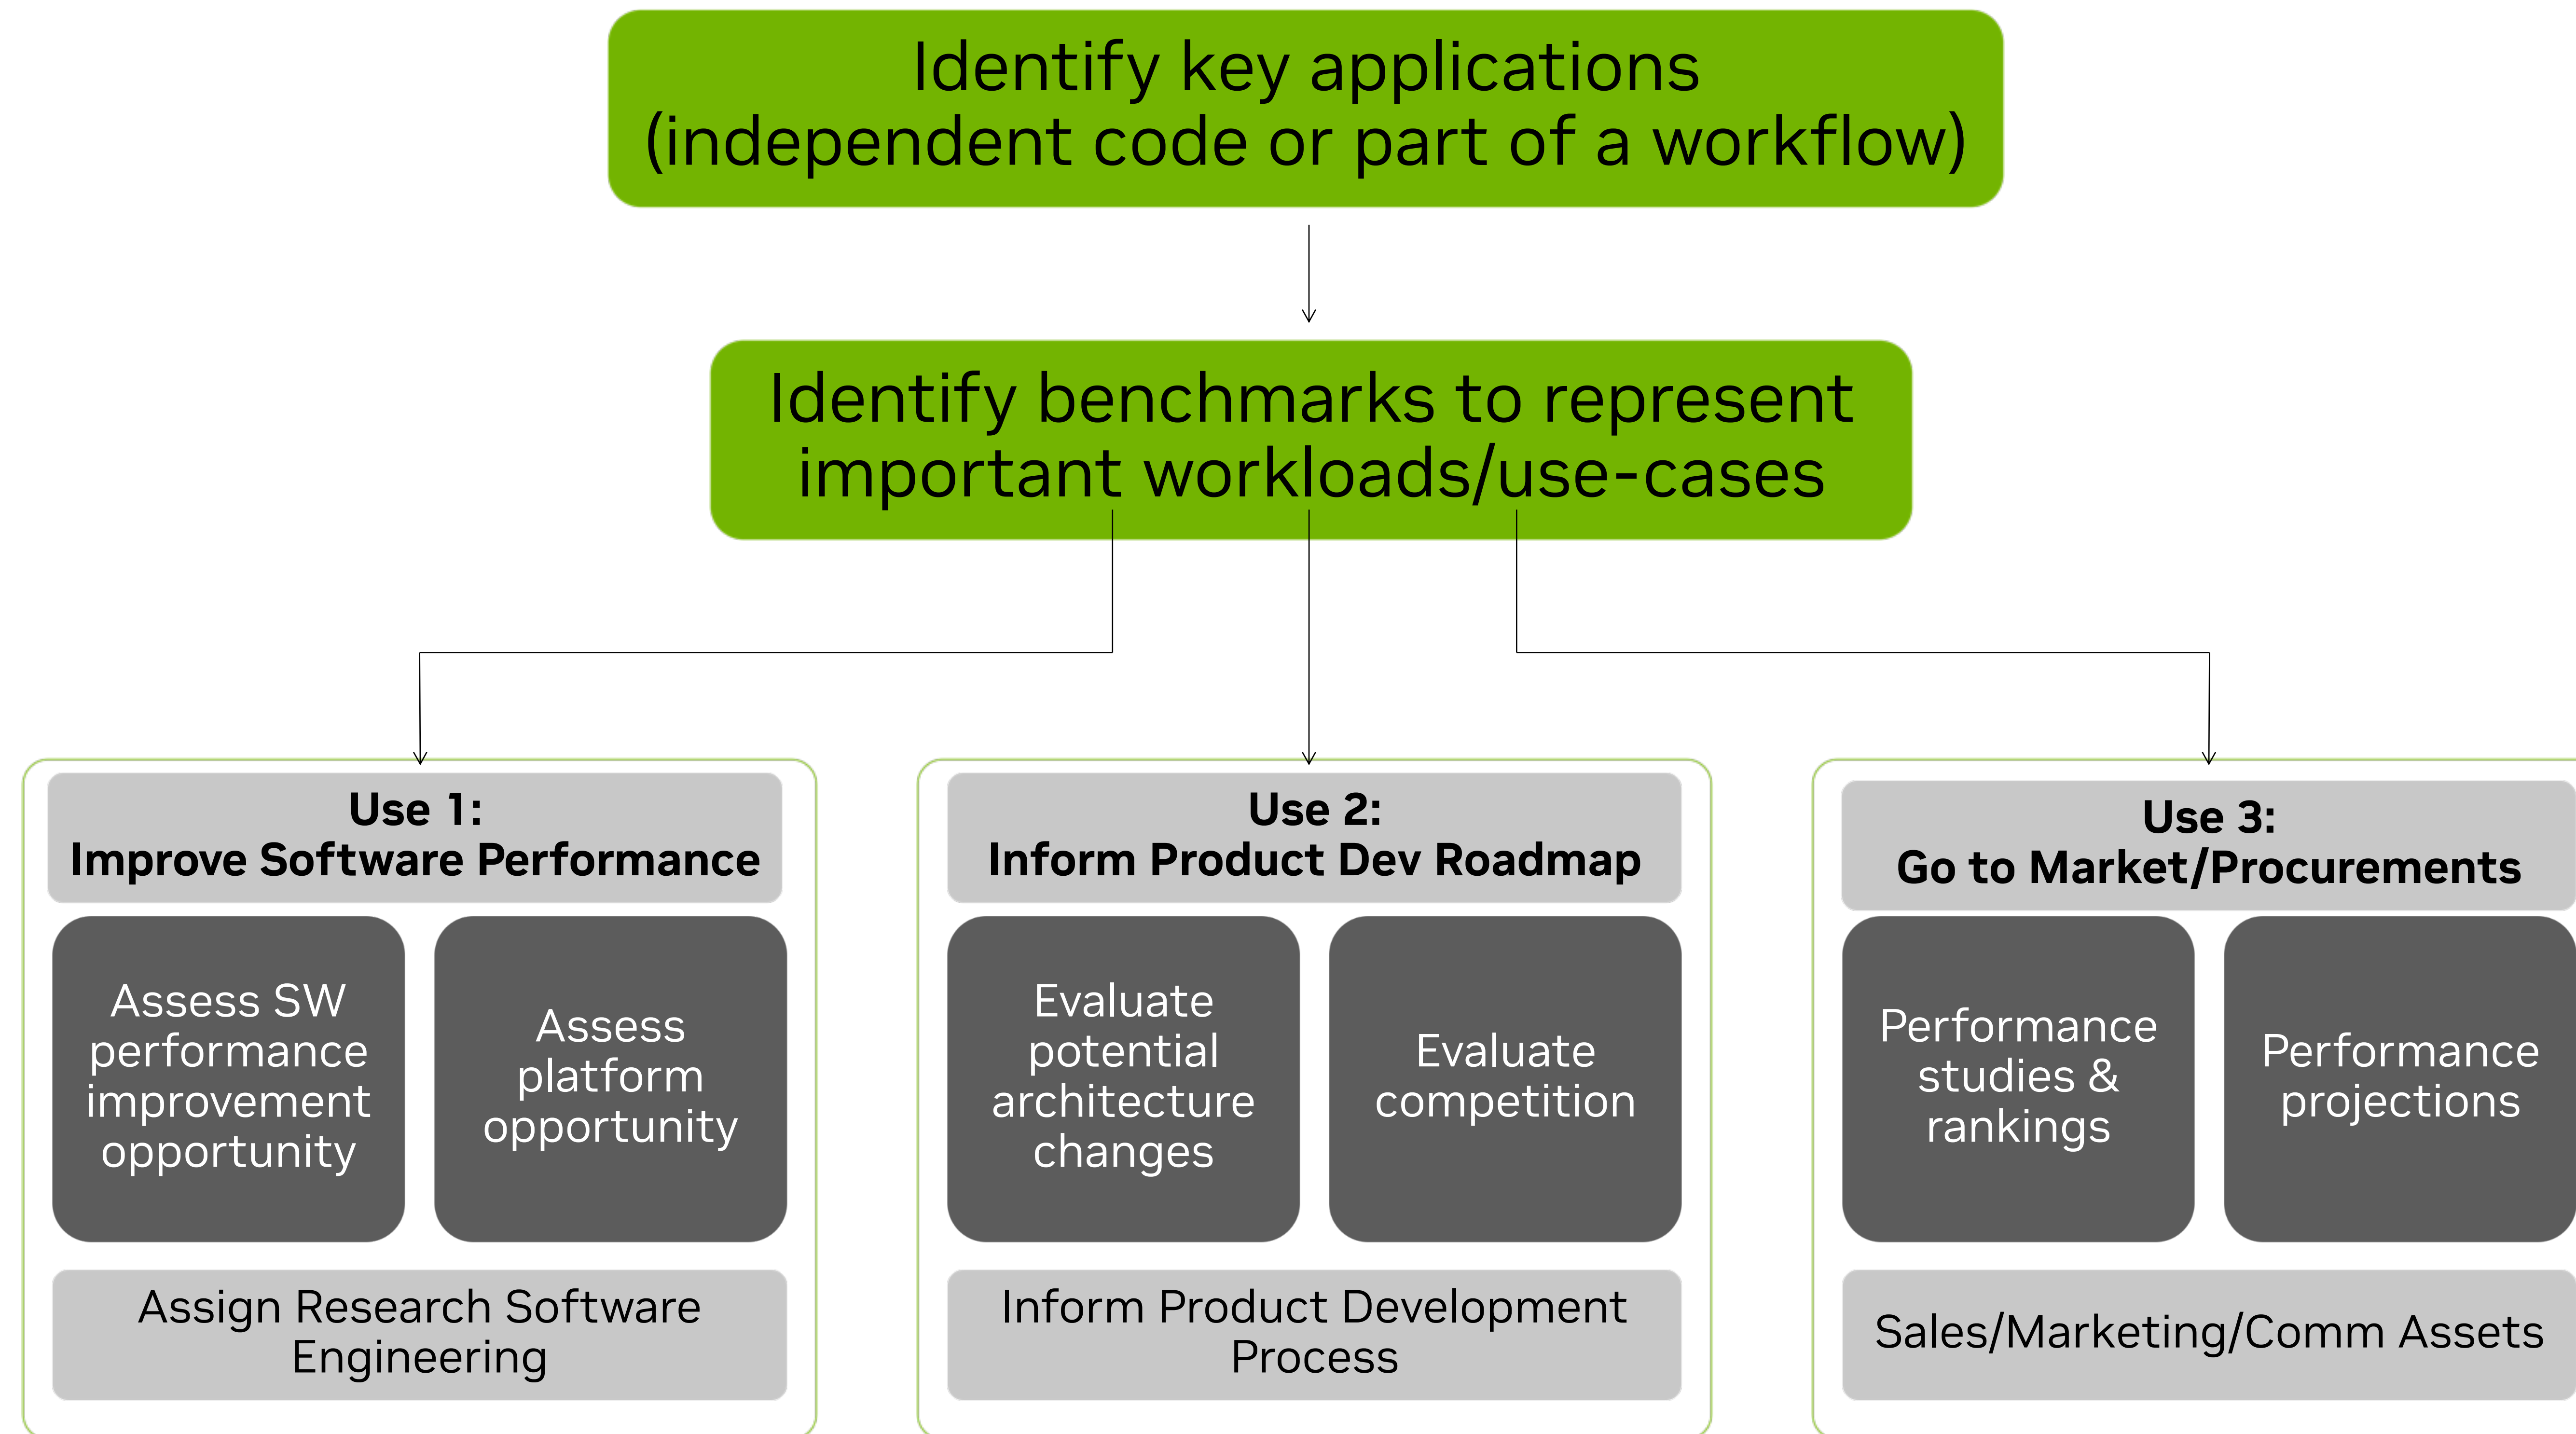

- Track science and engineering capability progress
- Realistic challenges for technology and system R&D – Influence industry
- High quality marketing and communications to stakeholders and society

Sustaining the vitality and relevance for benchmarking over time is difficult

- Increase open, community-based collaboration
- Having the application developers remain connected with benchmark curation is an advantage
- Ongoing discussion of science benchmarks outside of “business motion” should improve quality

Application Benchmarks in NVIDIA

Process

The ultimate impact depends critically on the ability to identify the important research domains on which to work

Influence through Communicating Benchmark Lists

Well curated and communicated lists of benchmarks have proven to be very influential.

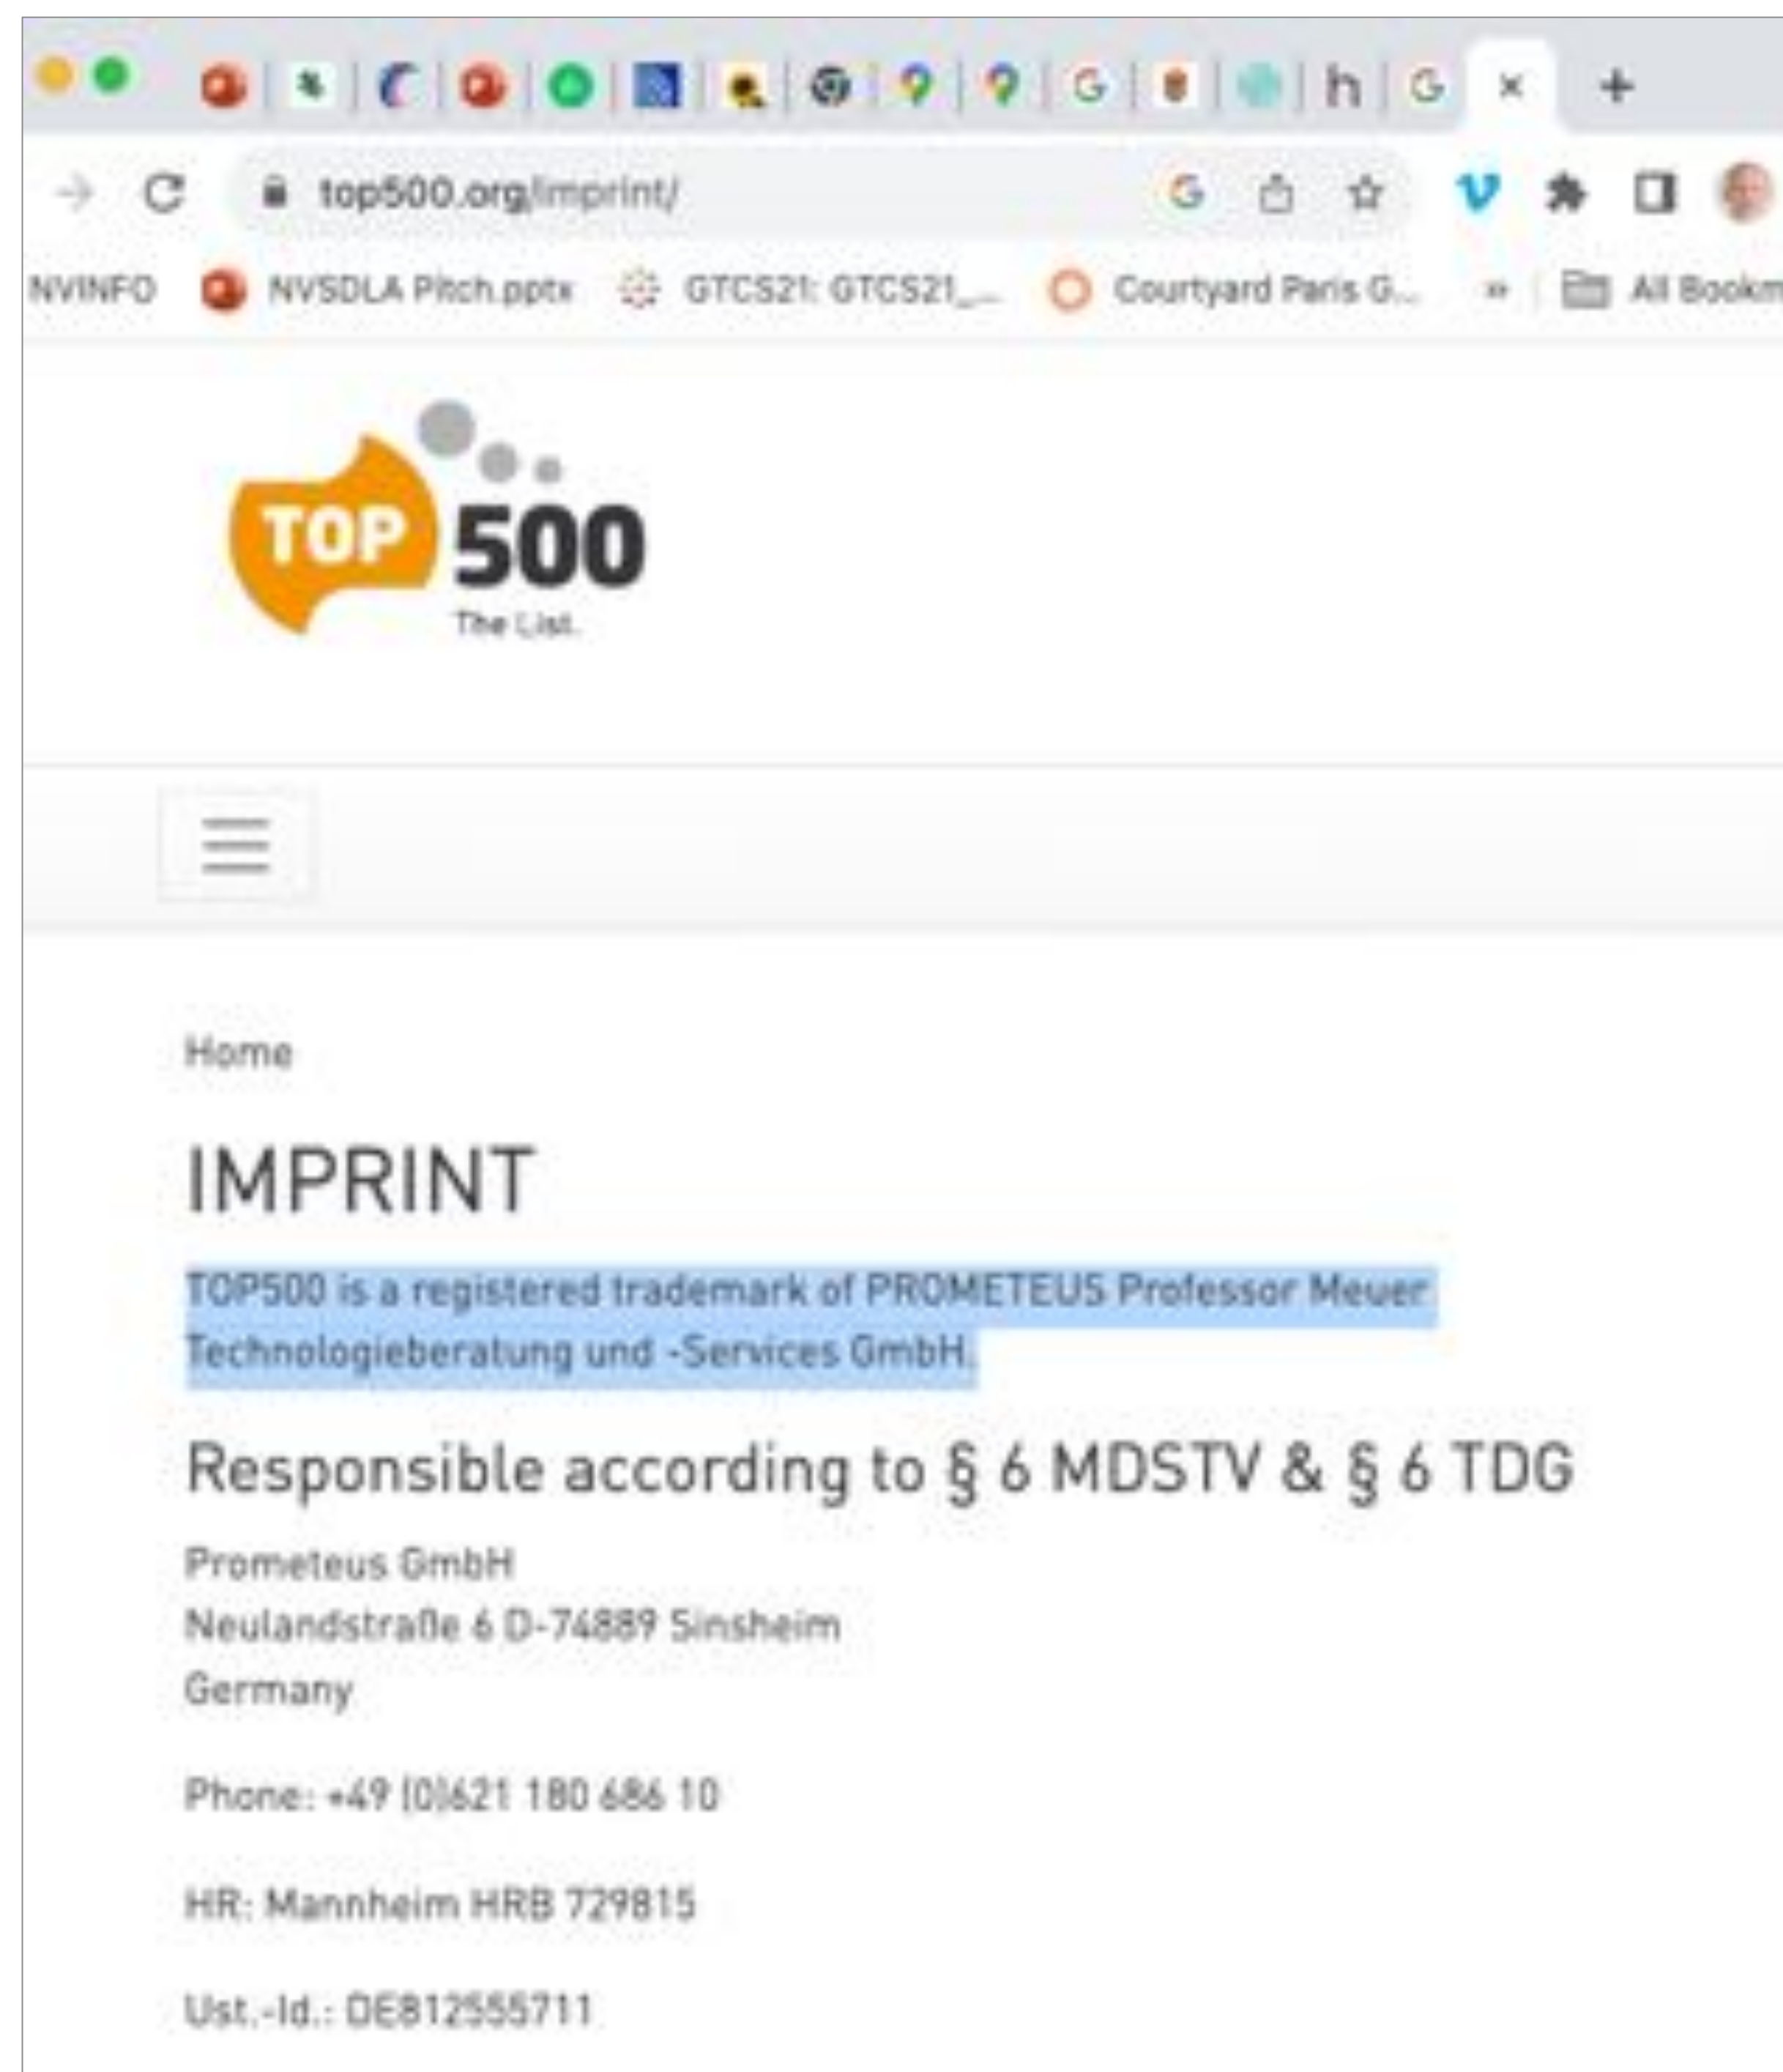

- TOP500™ is a notable example – See Jack Dongarra's A.M. Turing Award Lecture
- Pay attention to the principles of effective marketing and communication

Benchmarking efforts that aspire to similar influence must not overlook the important role of marketing and communications for their work.

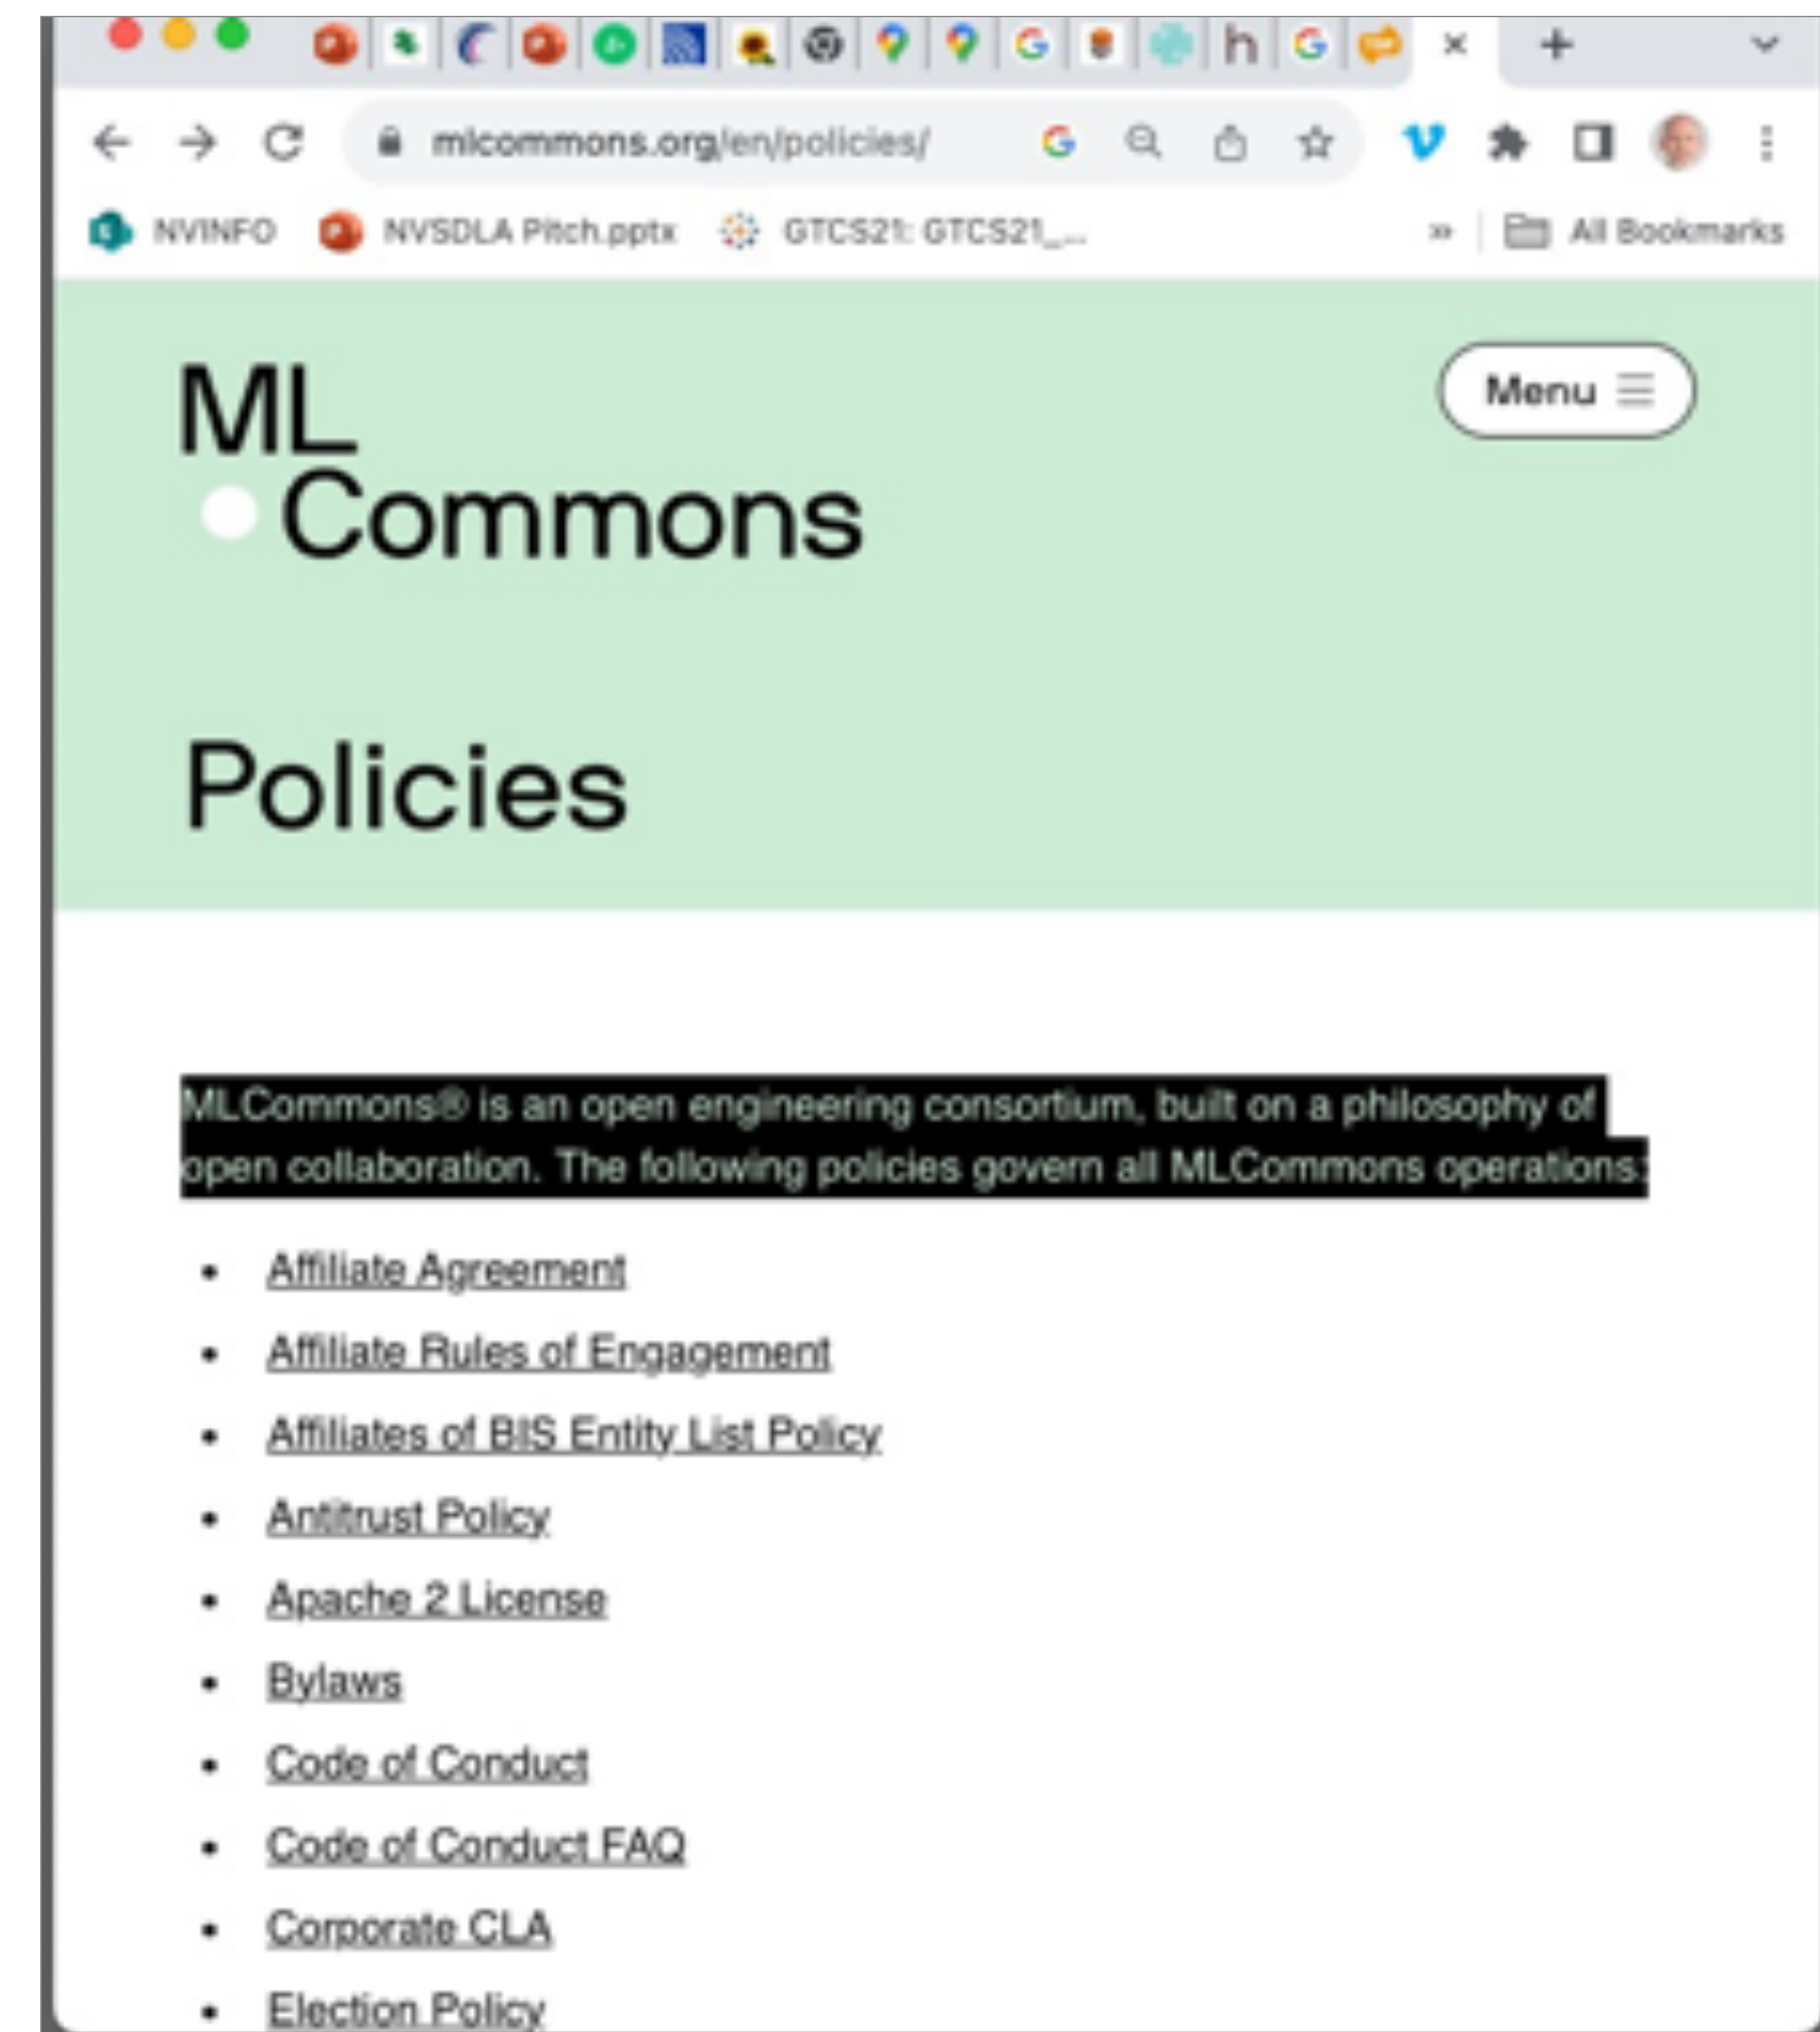

Various Governance Models Used for Sustainability

Two Examples

TOP500™ is the property of a small, private company

MLPerf governance is based on open standards.

Energy efficiency has grown to a primary consideration

Need to trade off performance against energy consumption

AI and HPC public perception problem

HPC datacenters consuming lots of energy seen as negative

Demand for fast solutions only grows

Public understanding of science & methods poses challenges

Water and other resources important too

Nascent focus on datacenter water usage for cooling

Accelerated Computing Drives Energy Efficient Data Centers

Simulation + AI Supercharge Science

Light Sheet
Microscopy

Molecular
Dynamics

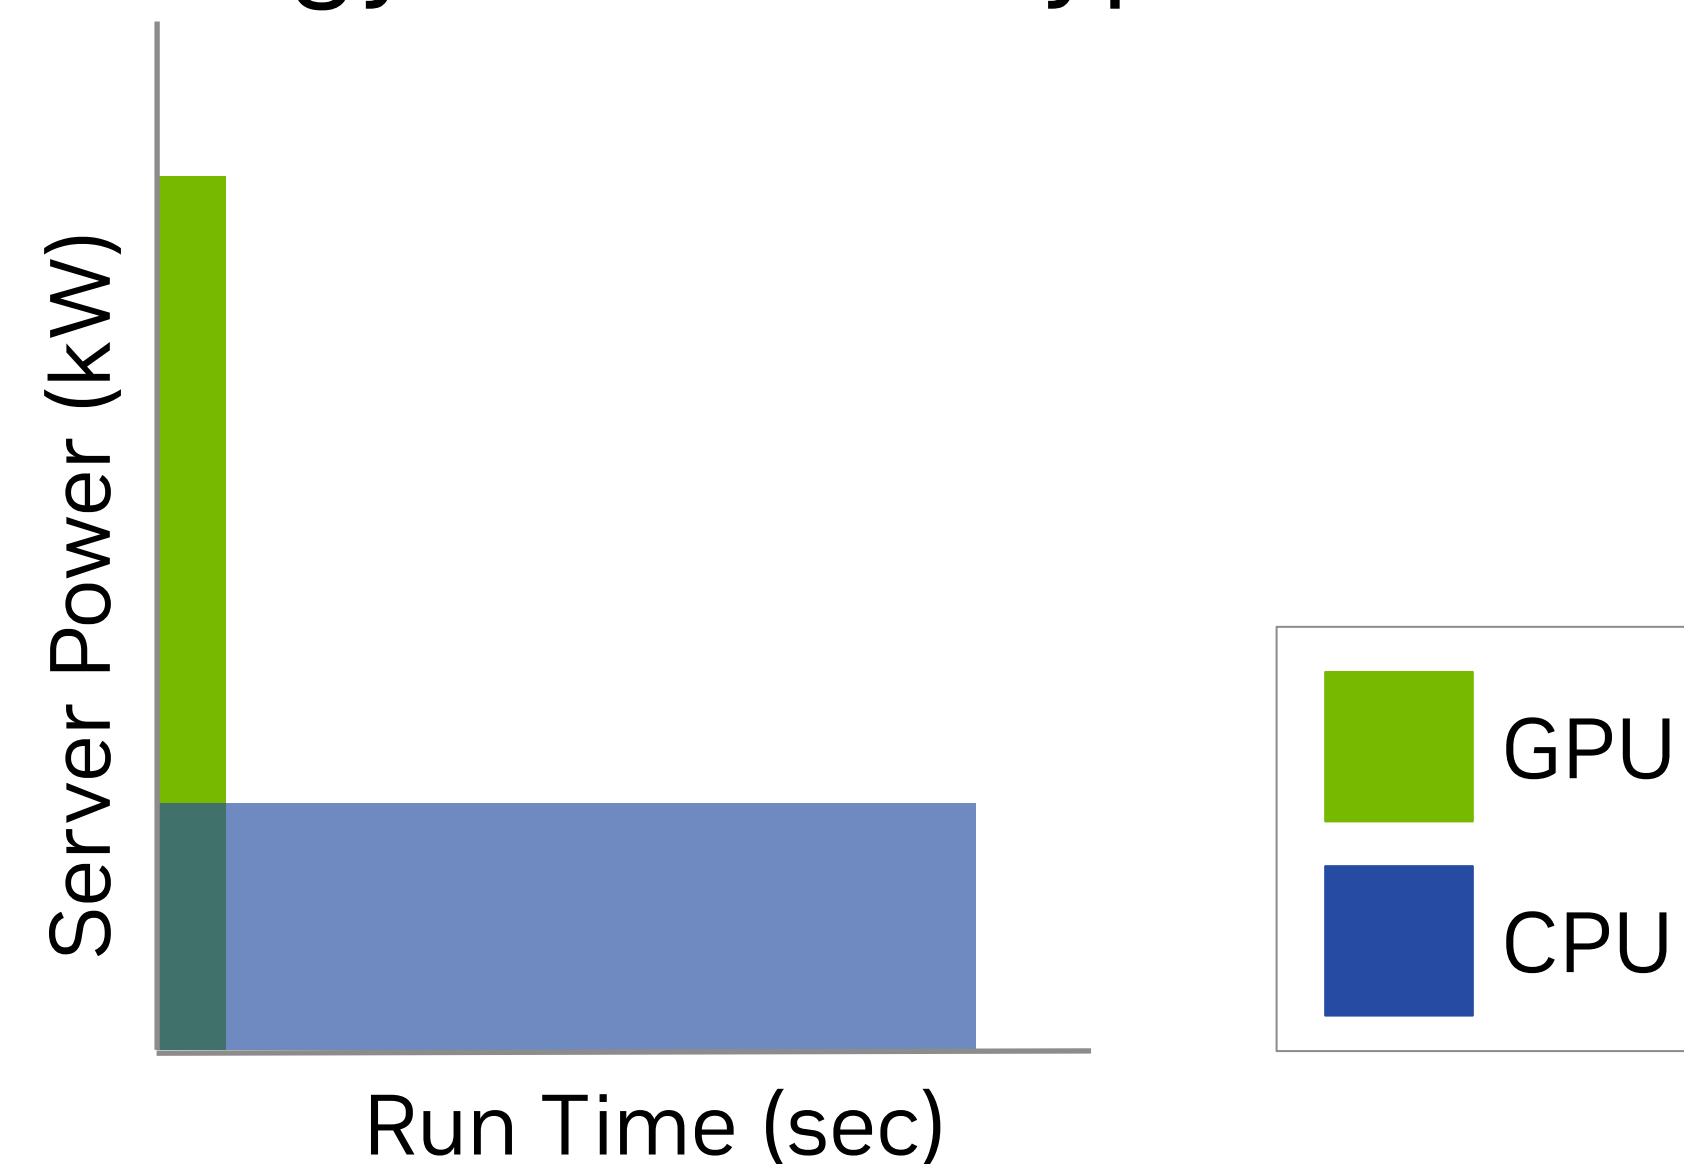

Climate
Simulation

Fluid Flow
Resolution

Energy Used in a Typical HPC task

Demand for Computational Science Growing

Compute Intensive Functions Drive Energy Consumption

GPUs Use Less Energy for HPC and AI

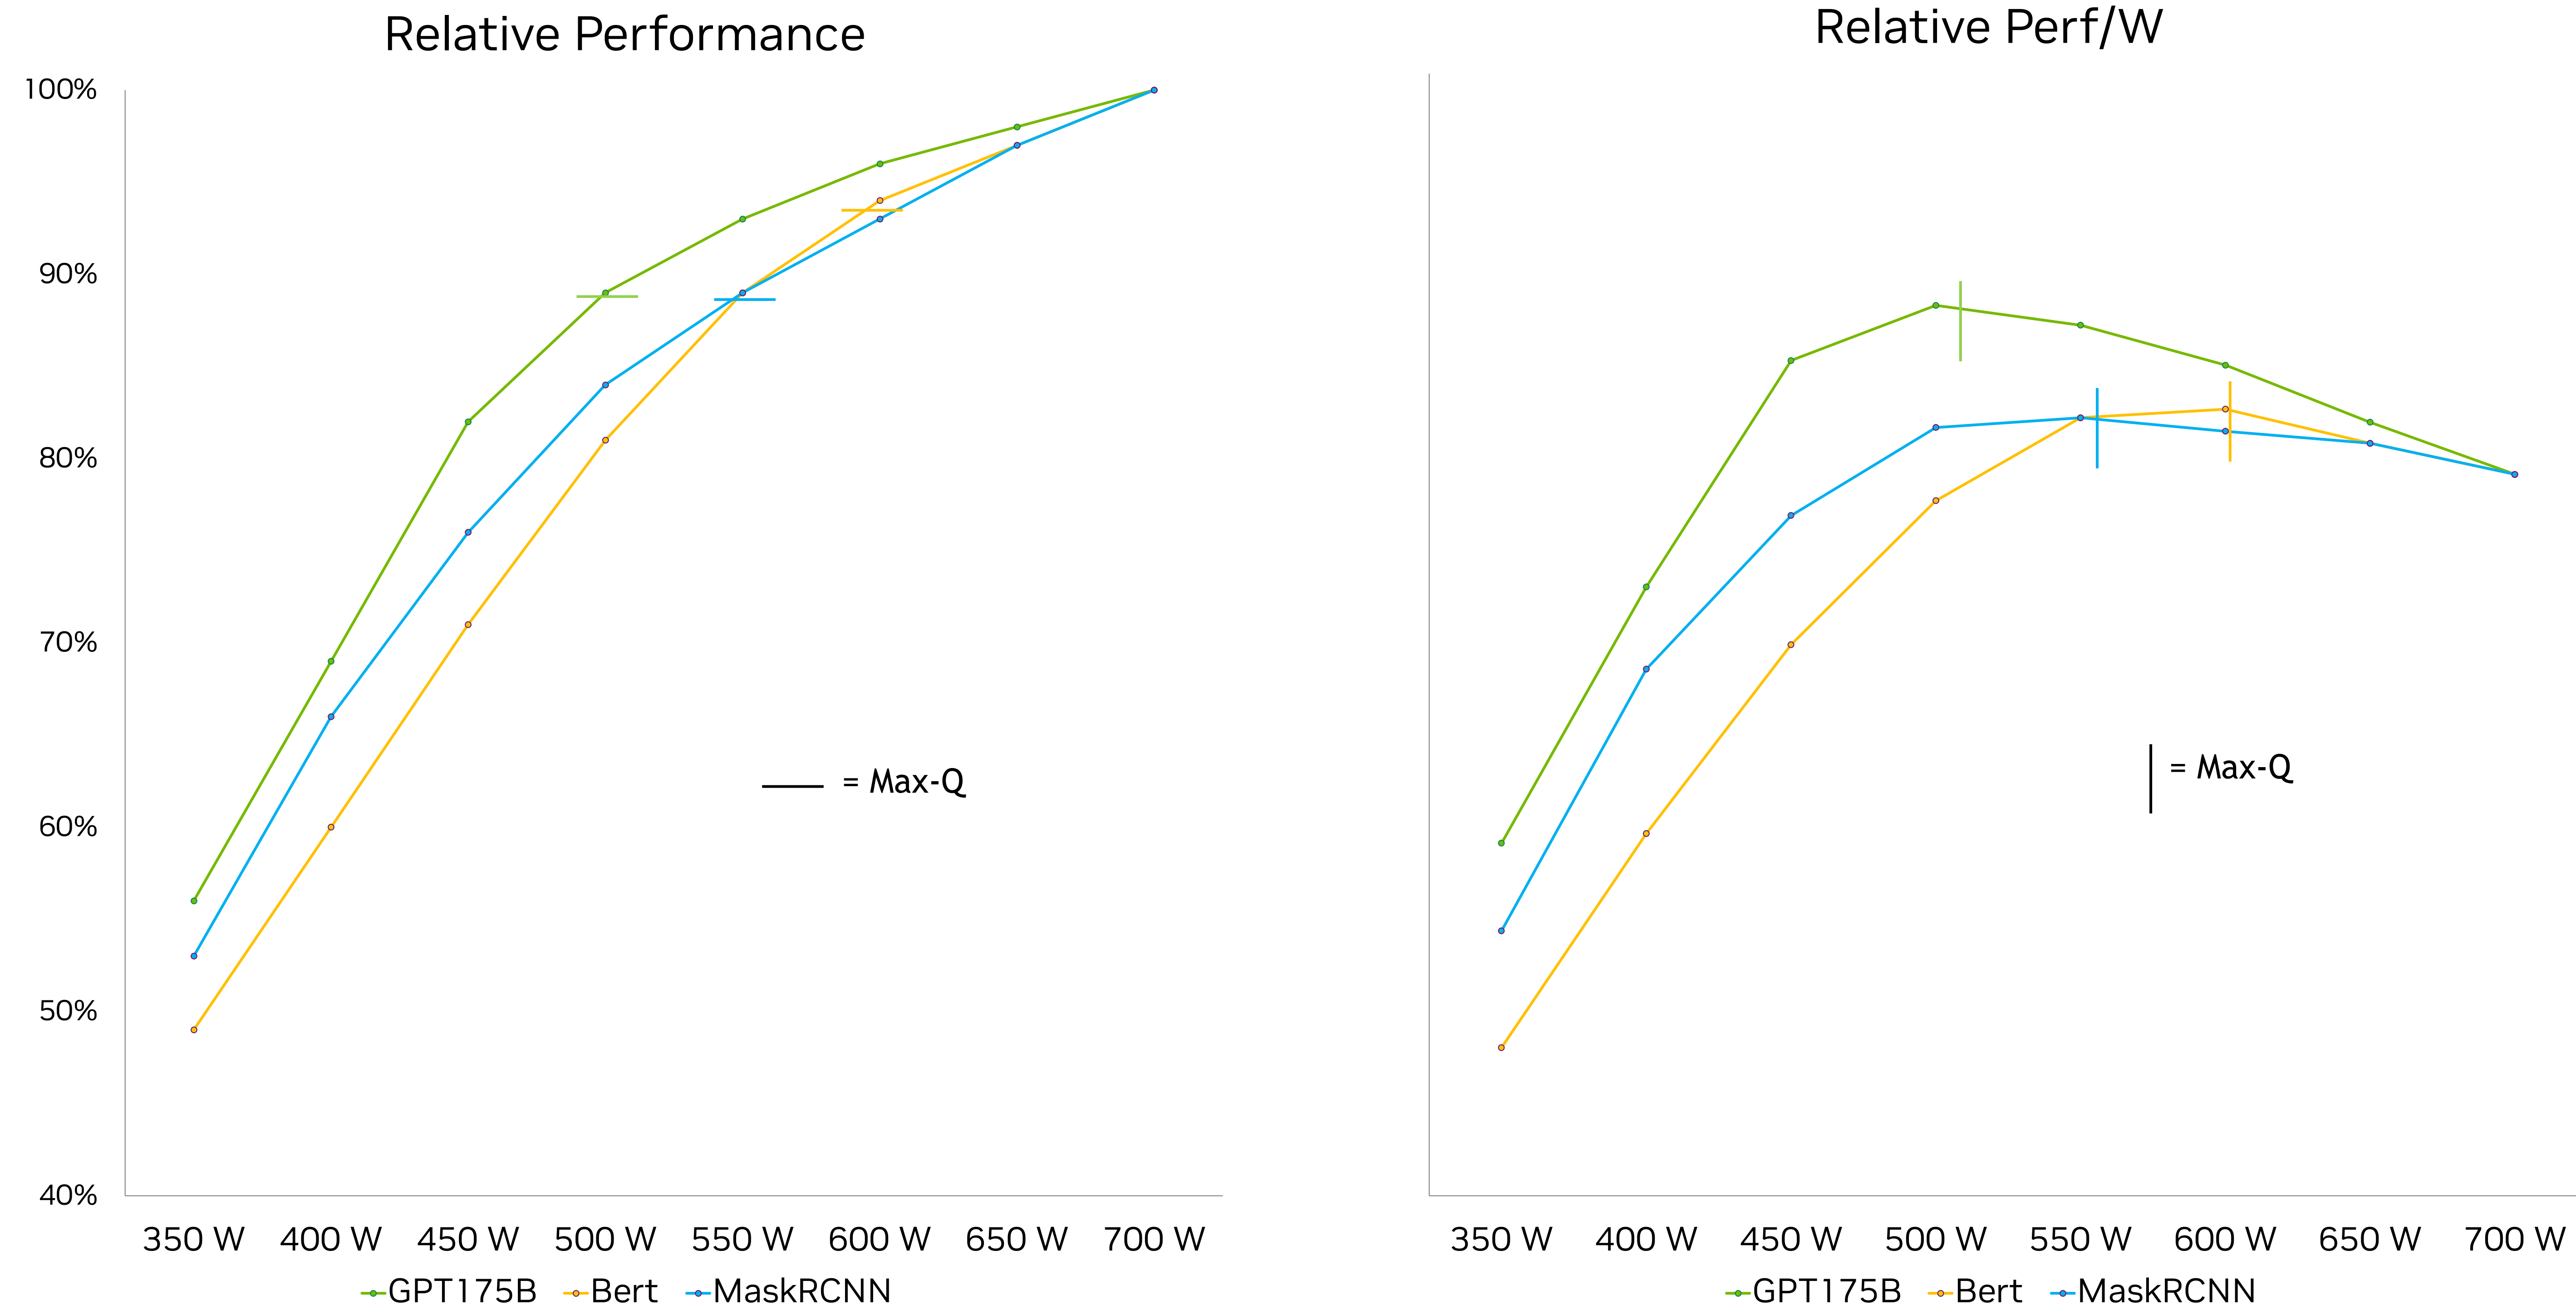

Rapid workload completion uses less energy overall

More Opportunities for Energy Efficiency

Increasing HPC and AI efficiency doesn't stop with acceleration

Energy-to-solution and Time-to-Solution

MaxQ: Running at the Power Efficiency Sweet Spot by Dynamic Power Capping

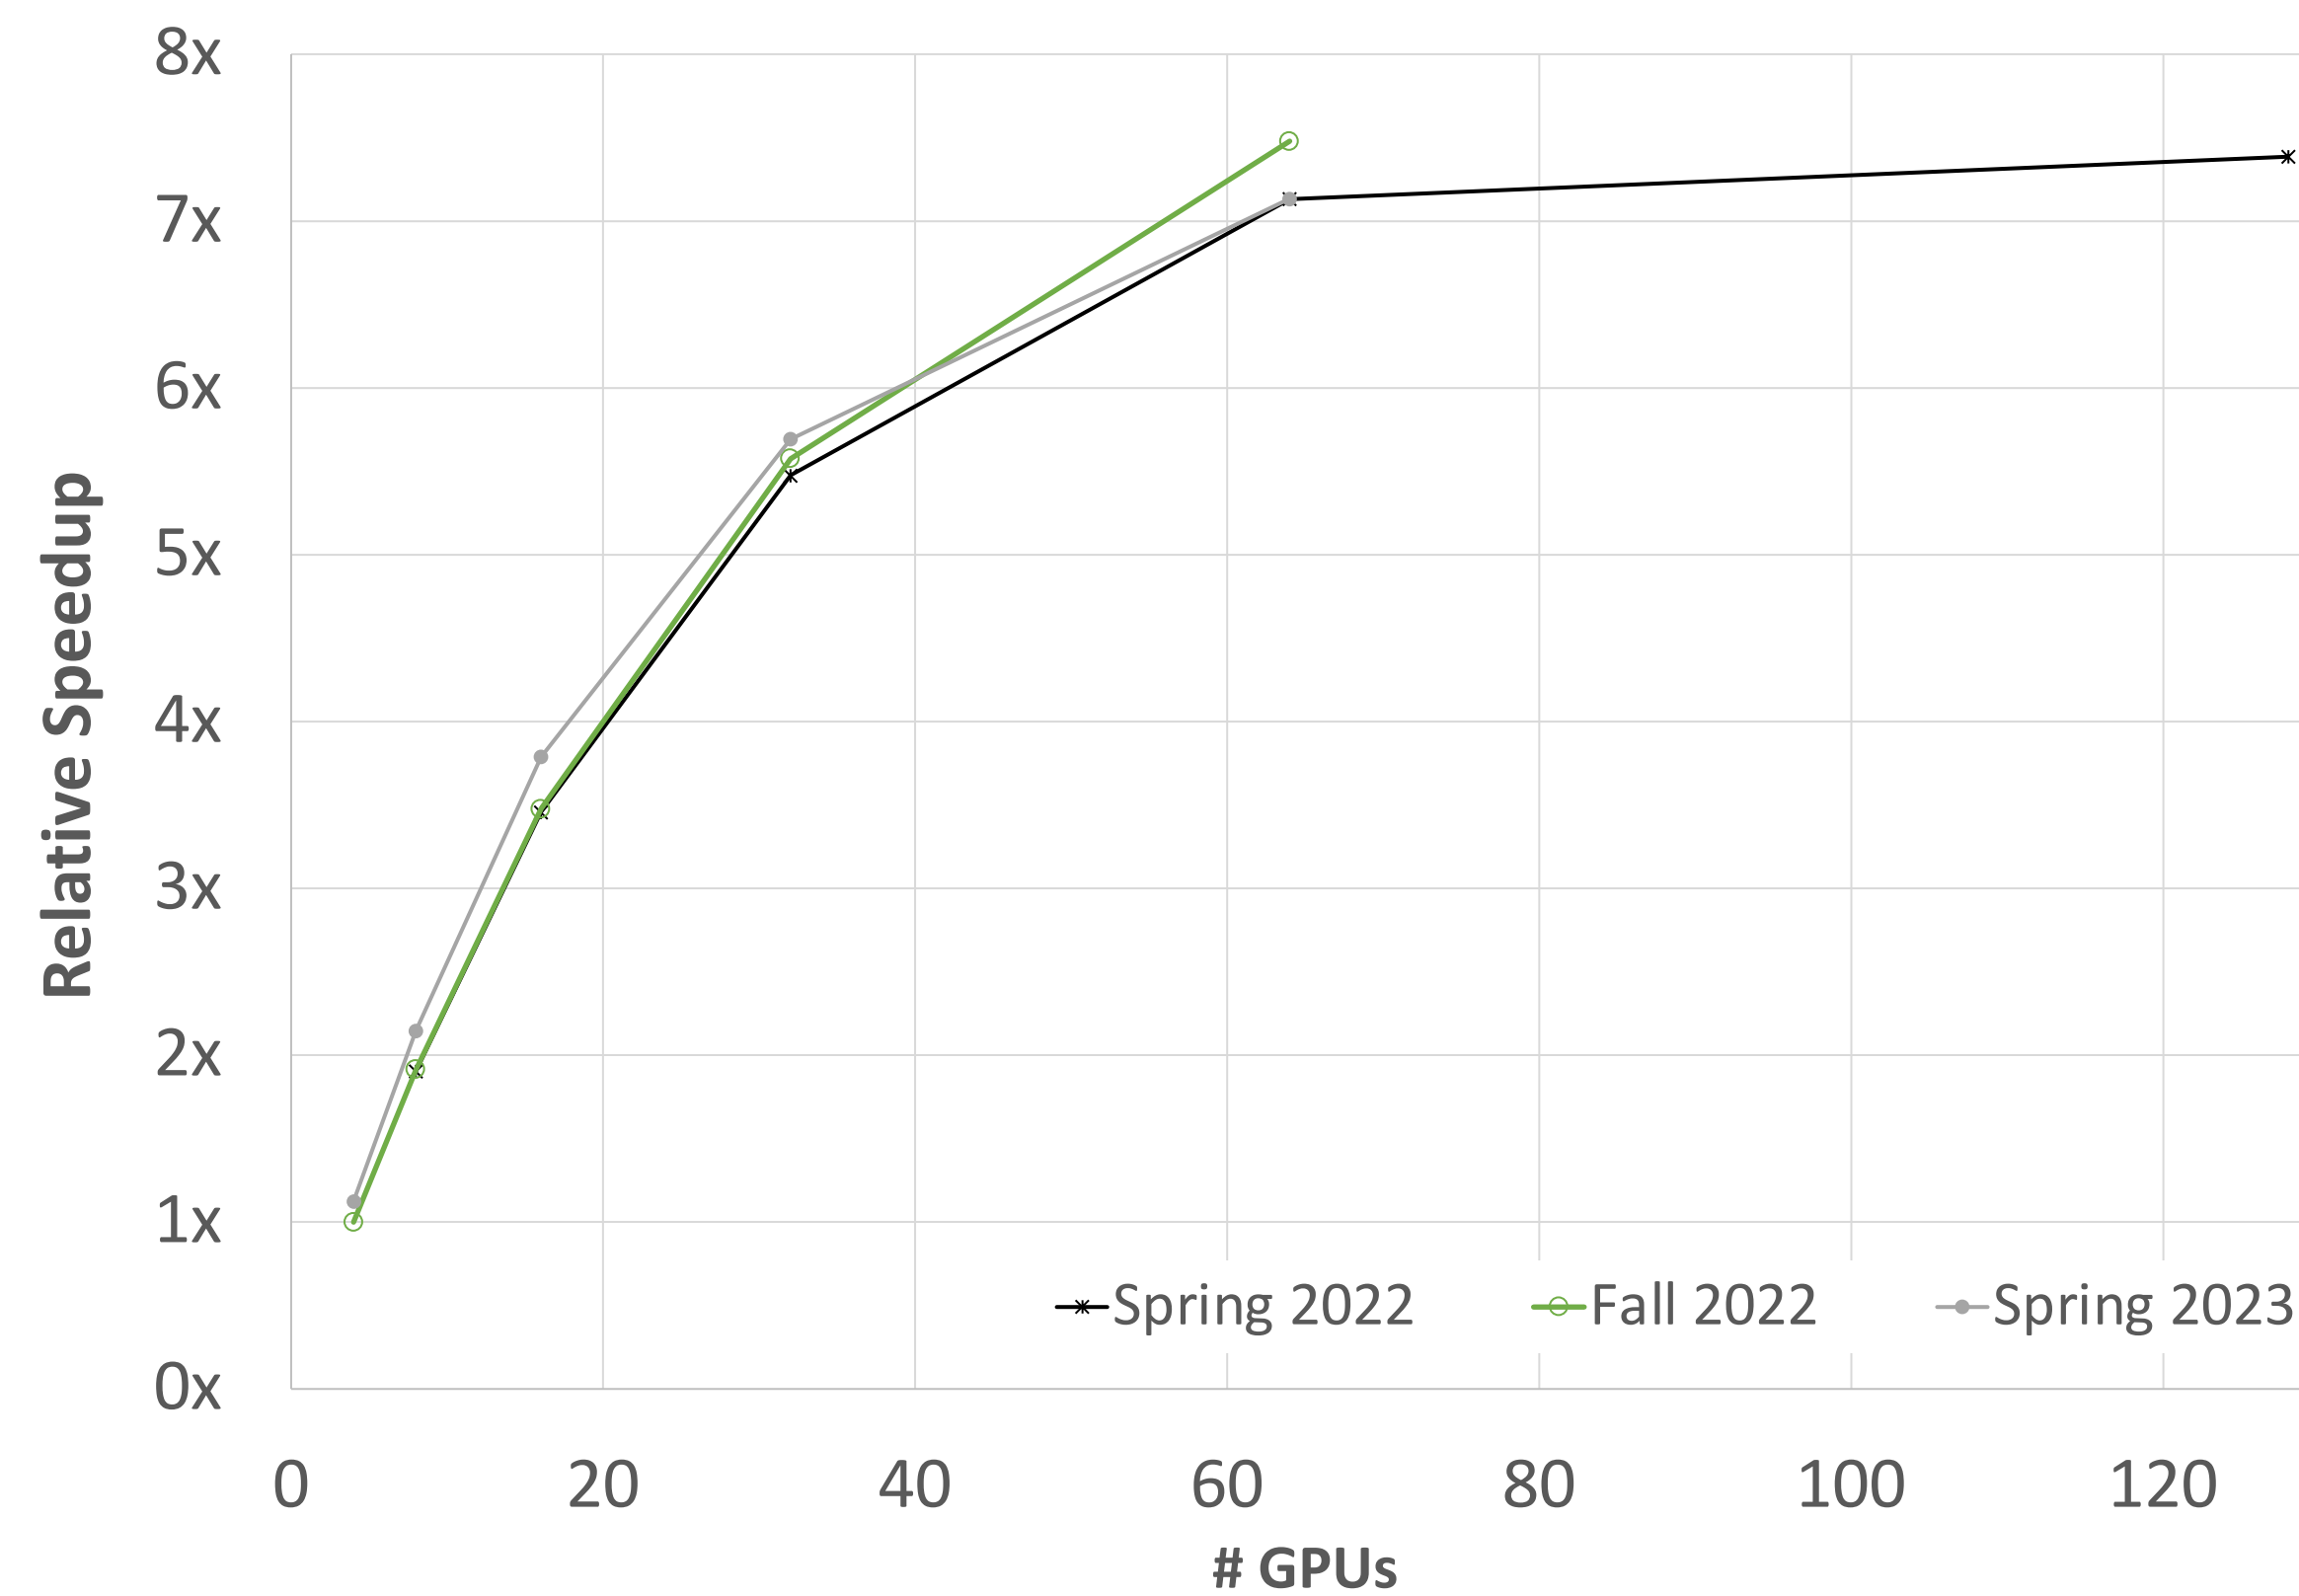

Systems: x86-hosted H100 HGX w/NVLink and IB interconnect. Workloads are training indicated models at scale:
GPT175B 8192 GPUs, Bert 8 GPUs, MaskRCNN 272 GPUs

Energy-to-solution and Time-to-Solution

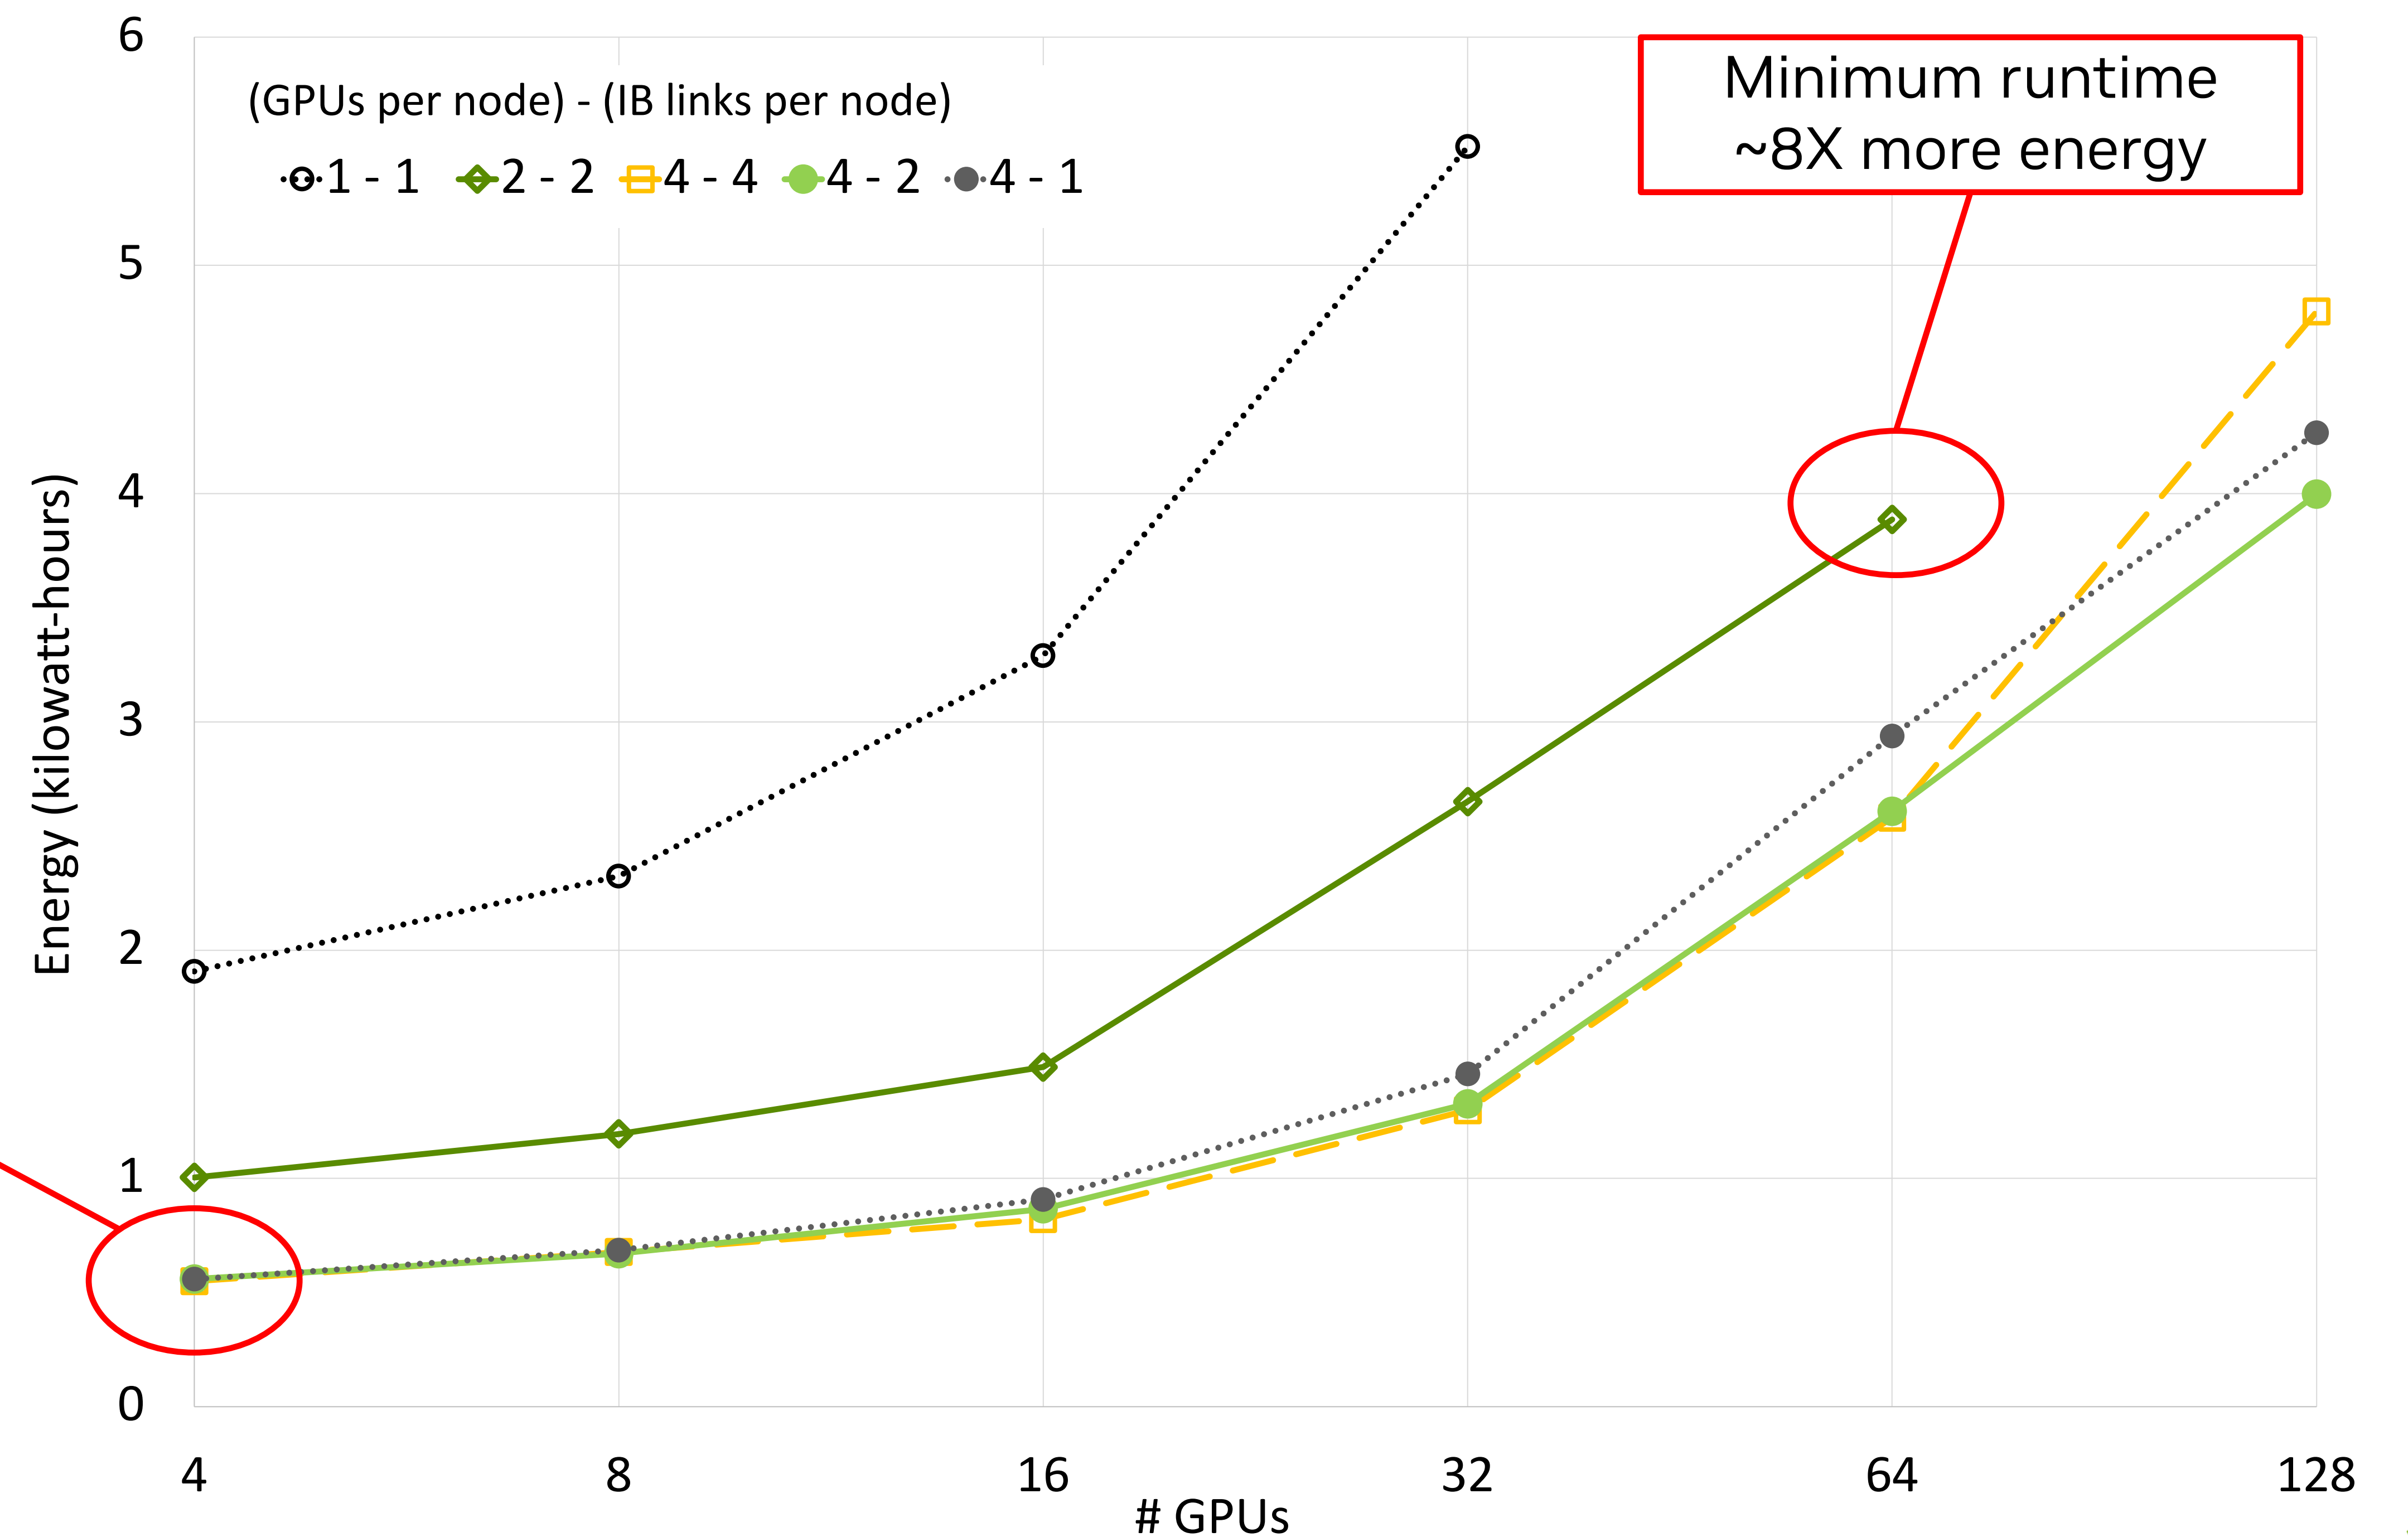

Need to trade off time-to-solution against resource (energy) consumption

Where on the scaling curve should we run?

FUN3D – Scaling Curve

FUN3D Energy Consumption

Energy Corrected Speedup

Best compromise between speed and energy consumption?

$$SPEEDUP_{energy} =: \frac{\left[\frac{runtime_1}{runtime_n} \right]}{\left[\frac{energy_n}{energy_1} \right]} = \frac{[runtime_1 * energy_1]}{[runtime_n * energy_n]}$$

*Minimize $[runtime_n * energy_n]$*

Offered as potential answers to symposium organizers questions:

- What metrics are the most valued?
- How do you characterize its performance?

Energy-to-solution and Time-to-Solution

Optimize Energy*Time

FUN3D Energy Corrected SPEEDUP

SC23 BoF: The Future of Benchmarks in Supercomputing (FoBS)

Wednesday, 15 November 2023,
5:15pm - 6:45pm MST

- The why?
 - Track science and engineering capability progress
 - Realistic challenges for technology and system design
 - High quality marketing and communications assets
- What?
 - Encourage open collaboration on HPC benchmarks
 - Think beyond LINPACK for science benchmarks
 - Energy-to-solution & Time-to-Solution
 - Benchmarking workflows.
- How?
 - Encourage community collaboration
 - Inform and initiate FoBS workshops in 2024
 - Share best practices in communicating benchmark results

The screenshot shows the SC23 BoF presentation page. The header features the SC23 logo with 'DENVER' and 'NOV 12-17' below it, and a hamburger menu icon on the right. Below the header, a breadcrumb trail reads 'Home > Presentation'. The main title 'Presentation' is displayed in a large, bold font. The session title 'The Future of Benchmarks in Supercomputing' is followed by a detailed description: 'As supercomputing welcomes new workflows of simulations, data science and artificial intelligence in the Exascale era, the goal of this session is to pose, engage, debate, and address the question - "How should the SC community evolve performance benchmarks?". The session will be organized as presentations and panel discussions with audience participation that will invite active members of the Top500, HPCG, MLPerf, TeraSort, etc. and key personnel from industry, academia, and government to discuss the value, need and desire for evolving the benchmark suite that is inclusive and accommodative of emerging applications to guide future supercomputing system design and architecture.' To the right of the description, a teal box contains the session title 'Birds of a Feather', the date and time 'Wednesday, 15 November 2023 5:15pm - 6:45pm MST', the location 'Location: 702', and the topic 'Performance Measurement, Modeling, and Tools'. Below this, a teal button labeled 'NEXT PRESENTATION >' is shown, followed by a clock icon and the text 'STARTS IN 55:06:51'. At the bottom right, the text 'HPC for Geospatial (HPC4Geo)' is visible. The 'Session Leader' section features a teal header, a circular profile picture of Sreenivas Sukumar, and his name and affiliation 'Sreenivas Sukumar Hewlett Packard Enterprise (HPE)'. The 'Additional Session Leaders' section has a teal header and shows two more leaders: Jack Wells (NVIDIA Corporation) and Arti Gang (Hewlett Packard Enterprise (HPE)), each with a circular profile picture and their name and affiliation.

Presentation

The Future of Benchmarks in Supercomputing

As supercomputing welcomes new workflows of simulations, data science and artificial intelligence in the Exascale era, the goal of this session is to pose, engage, debate, and address the question - "How should the SC community evolve performance benchmarks?". The session will be organized as presentations and panel discussions with audience participation that will invite active members of the Top500, HPCG, MLPerf, TeraSort, etc. and key personnel from industry, academia, and government to discuss the value, need and desire for evolving the benchmark suite that is inclusive and accommodative of emerging applications to guide future supercomputing system design and architecture.

Birds of a Feather
Wednesday, 15 November 2023
5:15pm - 6:45pm MST
Location: 702
Performance Measurement, Modeling, and Tools

NEXT PRESENTATION >
STARTS IN 55:06:51
HPC for Geospatial (HPC4Geo)

Session Leader

Sreenivas Sukumar
Hewlett Packard Enterprise (HPE)

Additional Session Leaders

Jack Wells
NVIDIA Corporation

Arti Gang
Hewlett Packard Enterprise (HPE)

Additional Sustainability Topics

Grace CPU: Excellent Performance per Watt

OpenFOAM 2206, MotorBike 5M

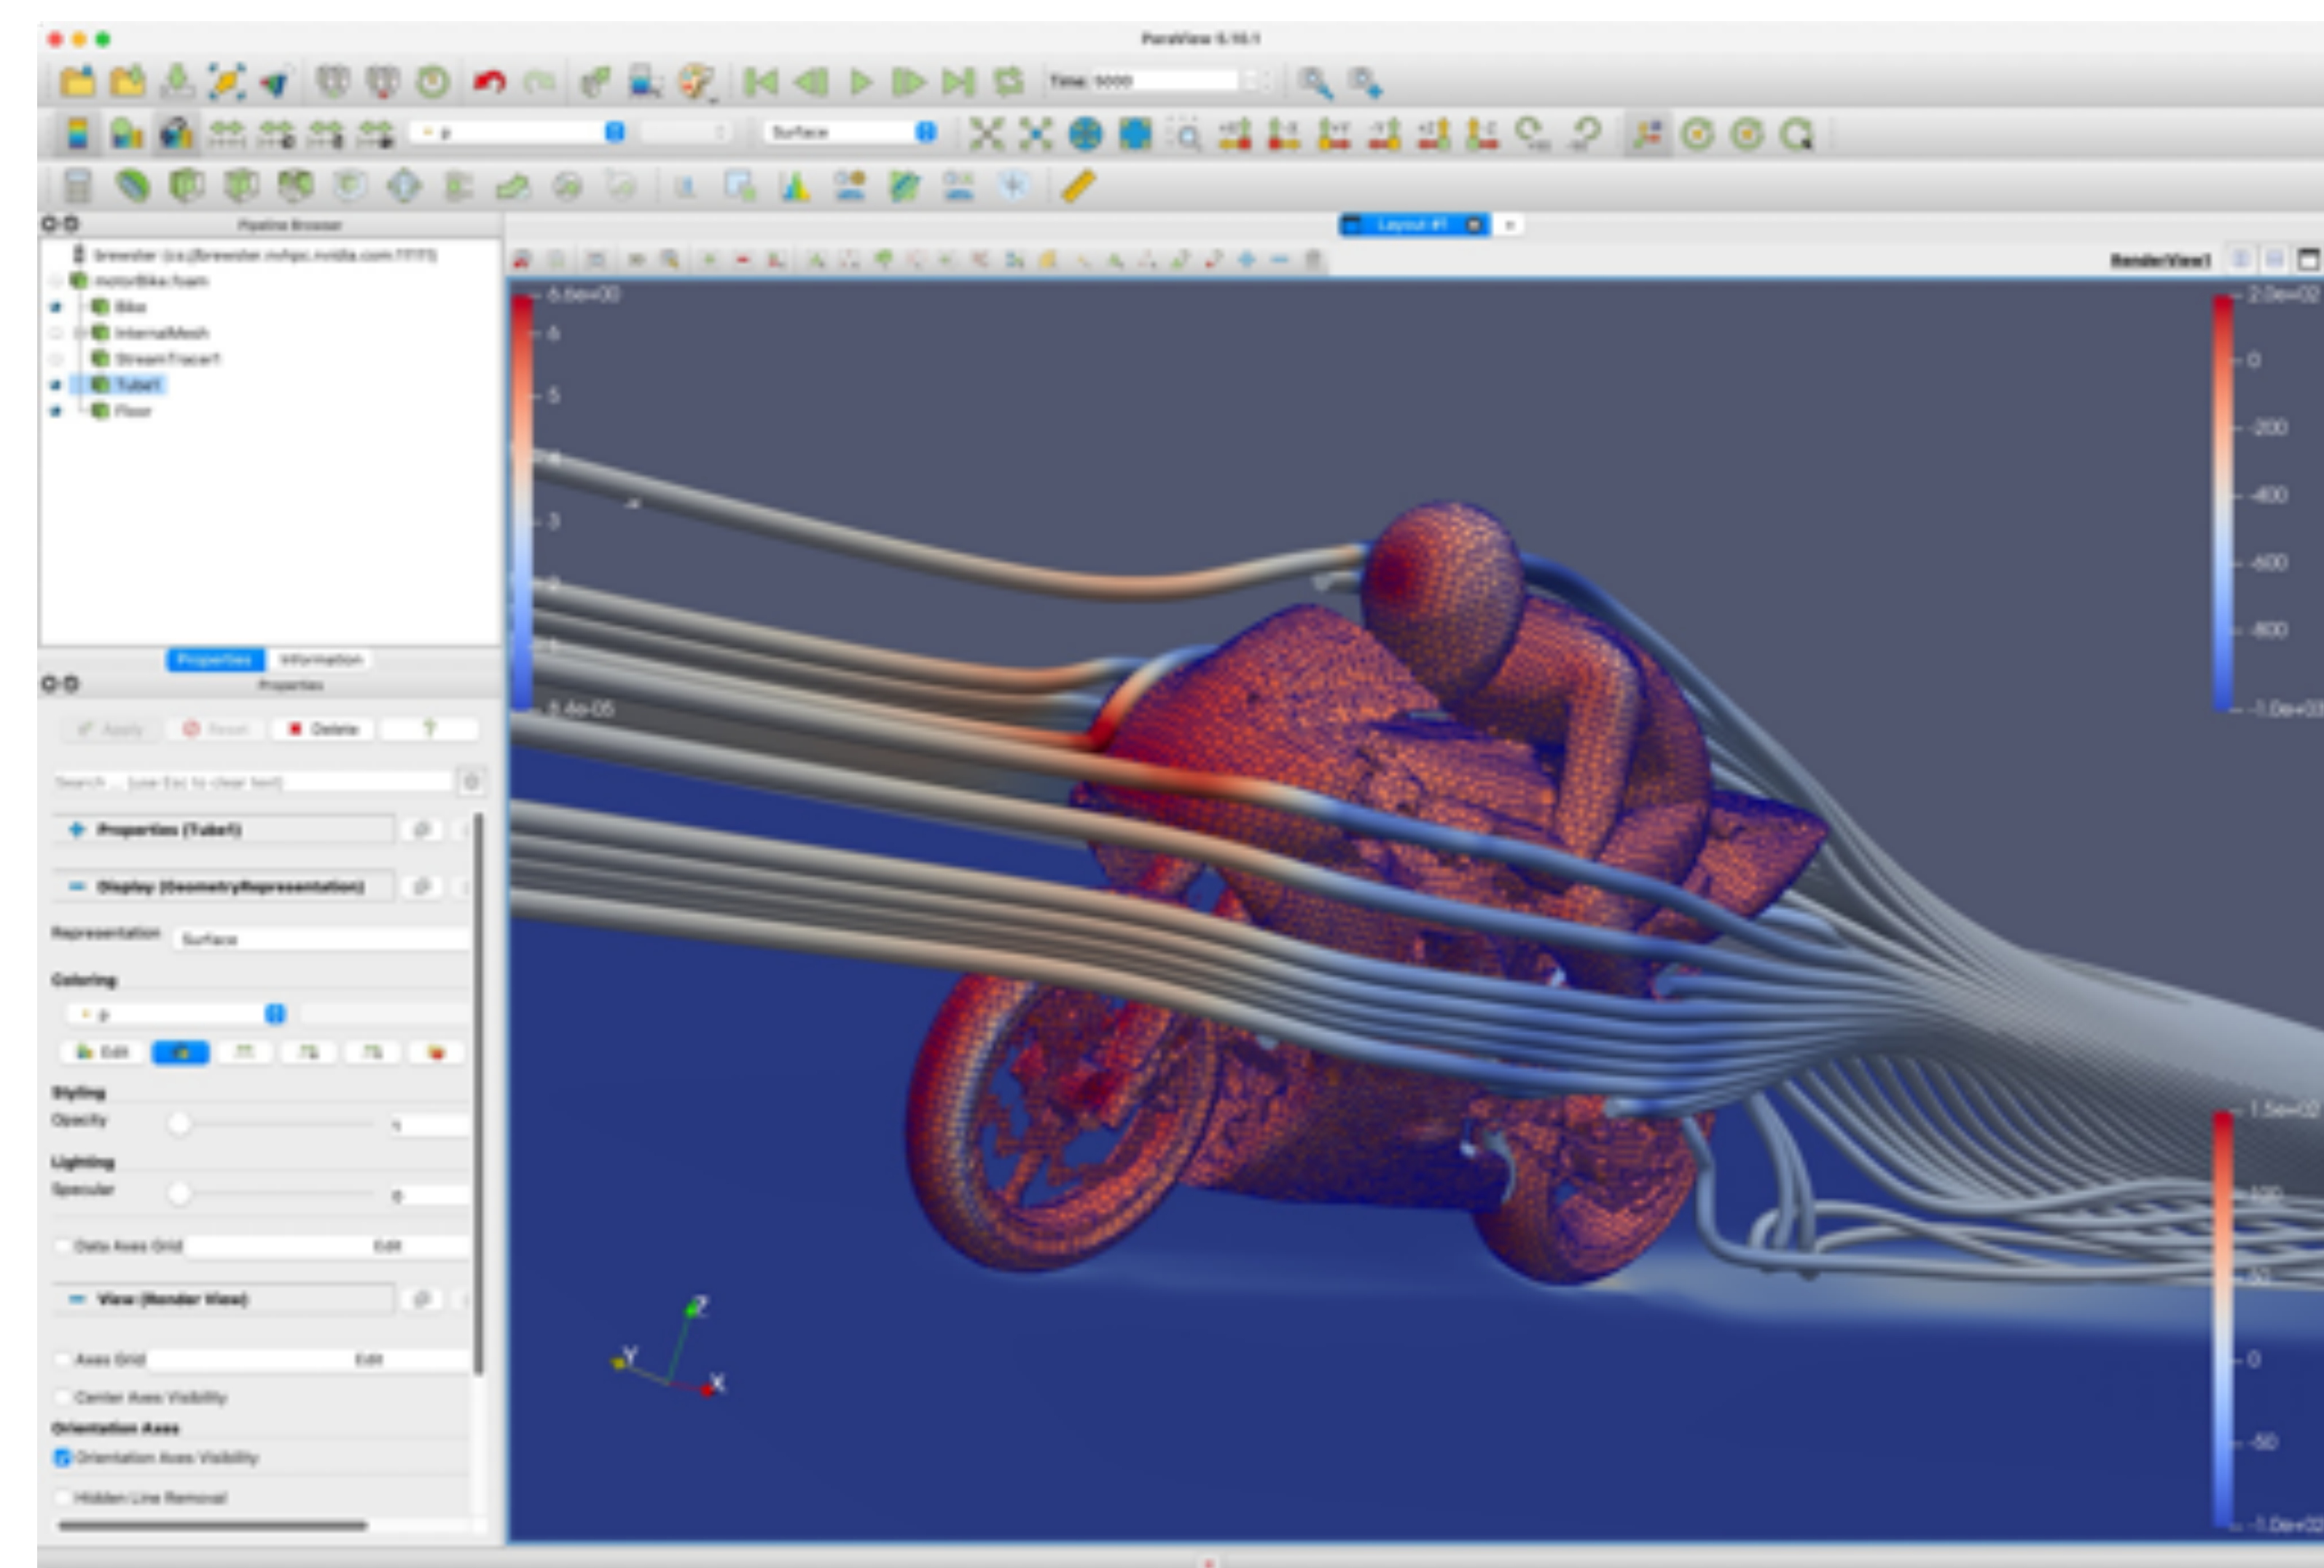

Sapphire Rapids: Intel Xeon Platinum 8470Q, 52c @ 2.1GHz - 3.8GHz

Genoa: AMD EPYC 9654, 96c @ 1.5GHz - 3.7GHz

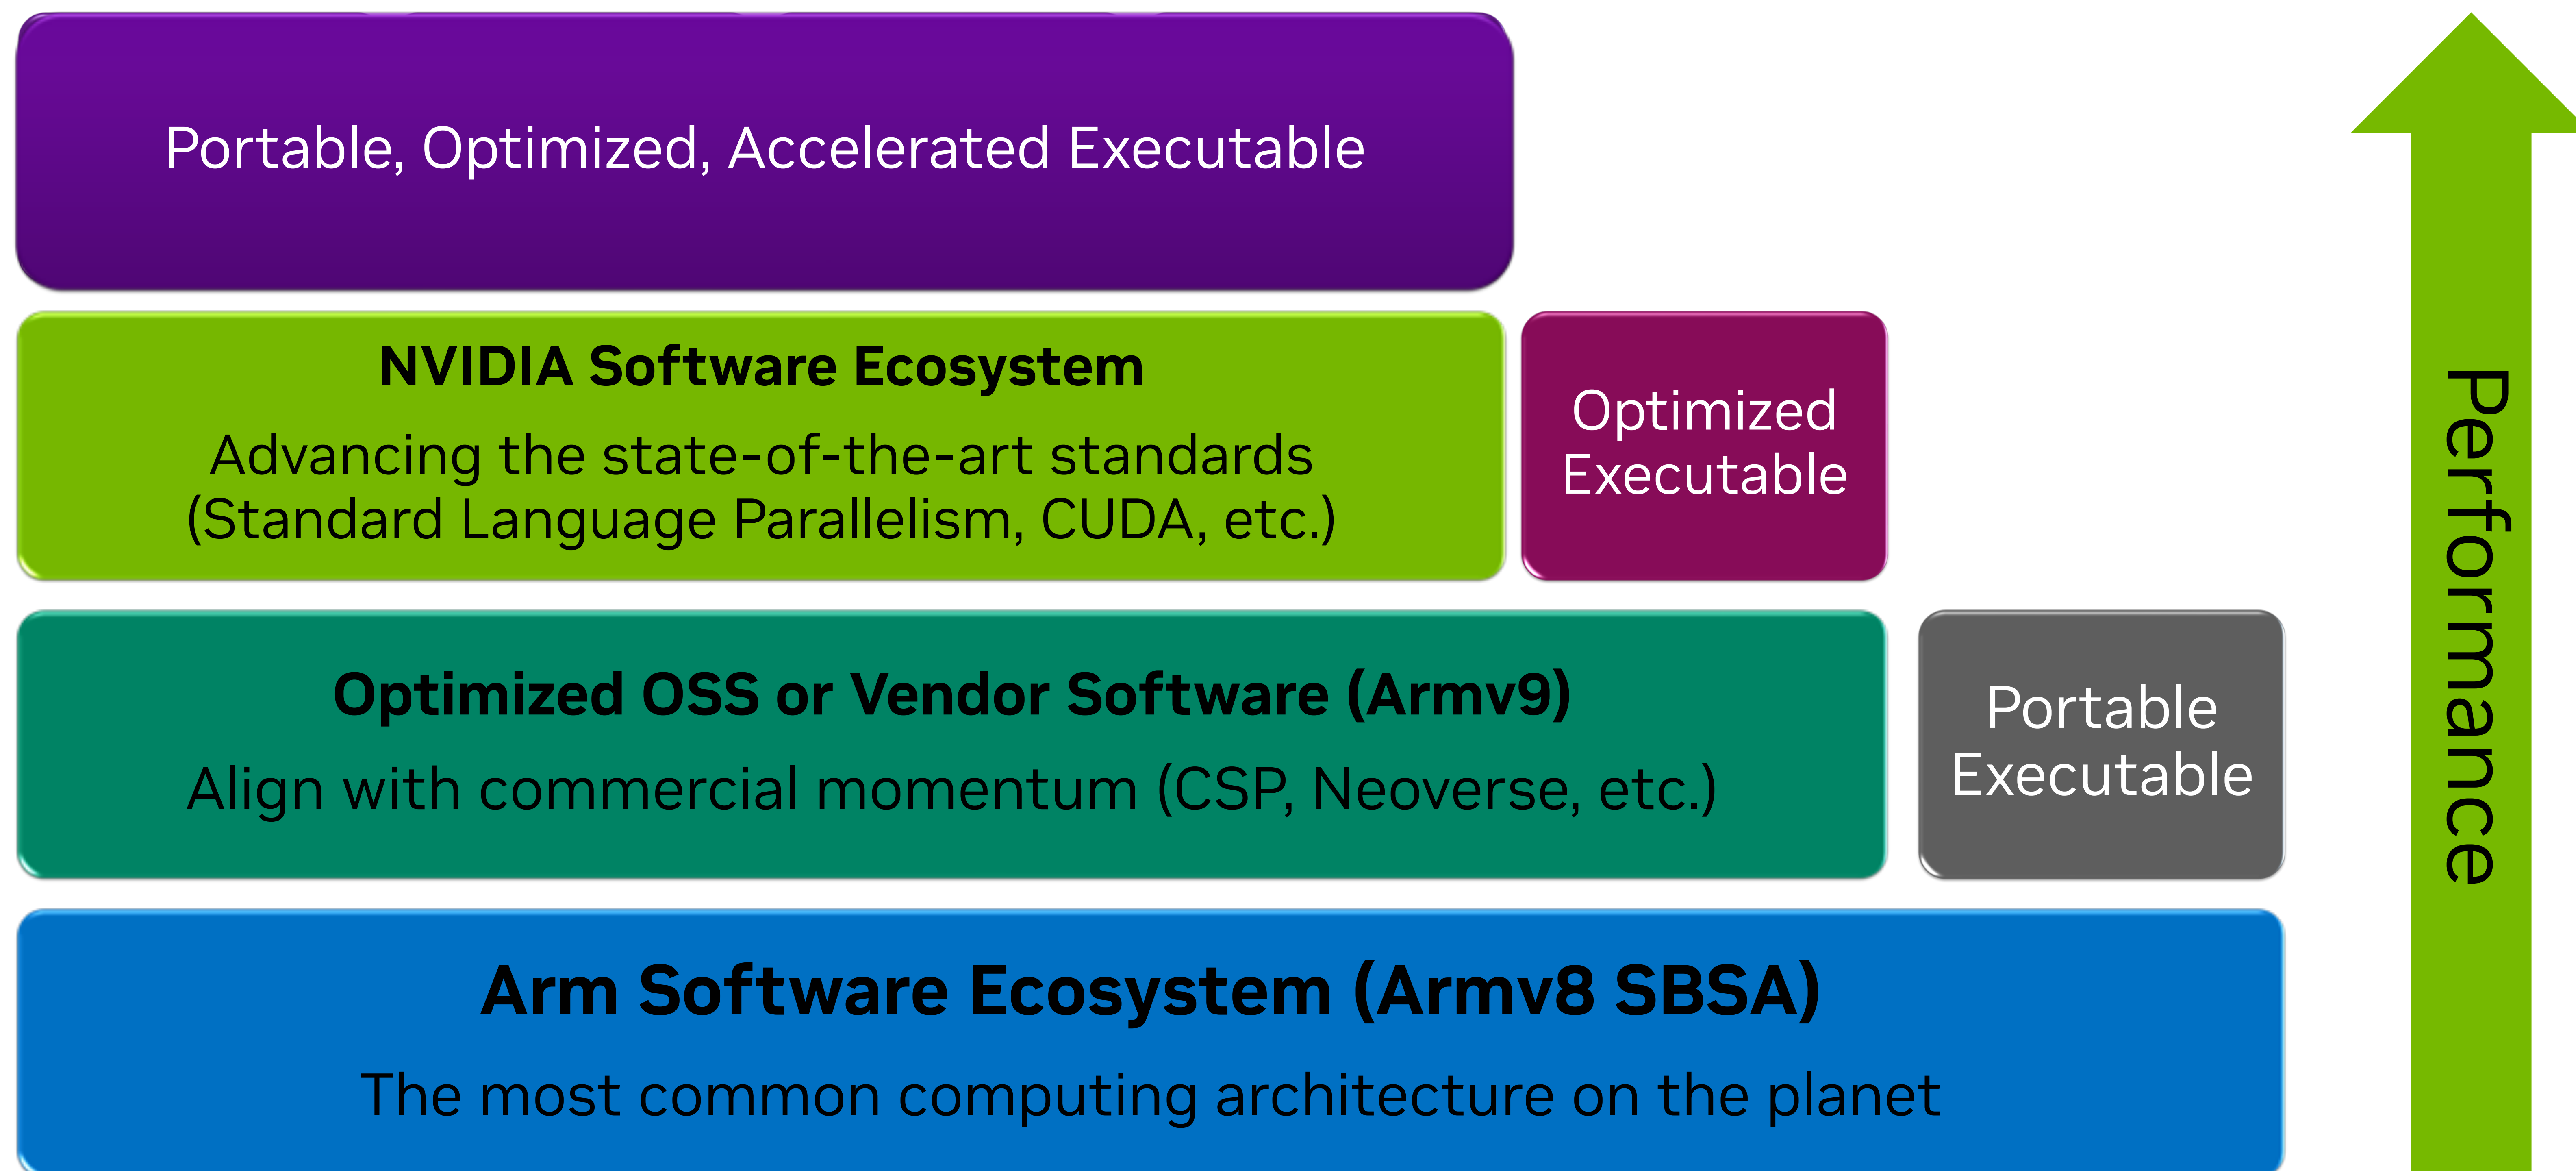

Grace: NVIDIA Engineering Sample, 72c @ 3.2GHz

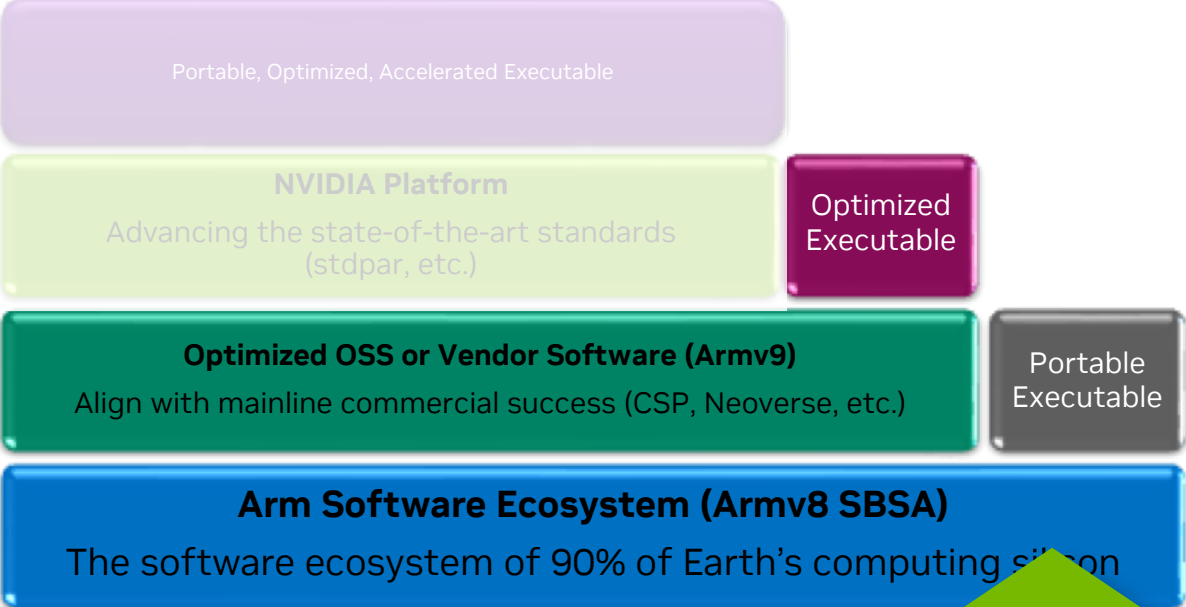

Best single socket time using best compilers (GCC, ICC, AOCC) and best rank/thread decomposition

Grace Software Ecosystem is Built on Standards

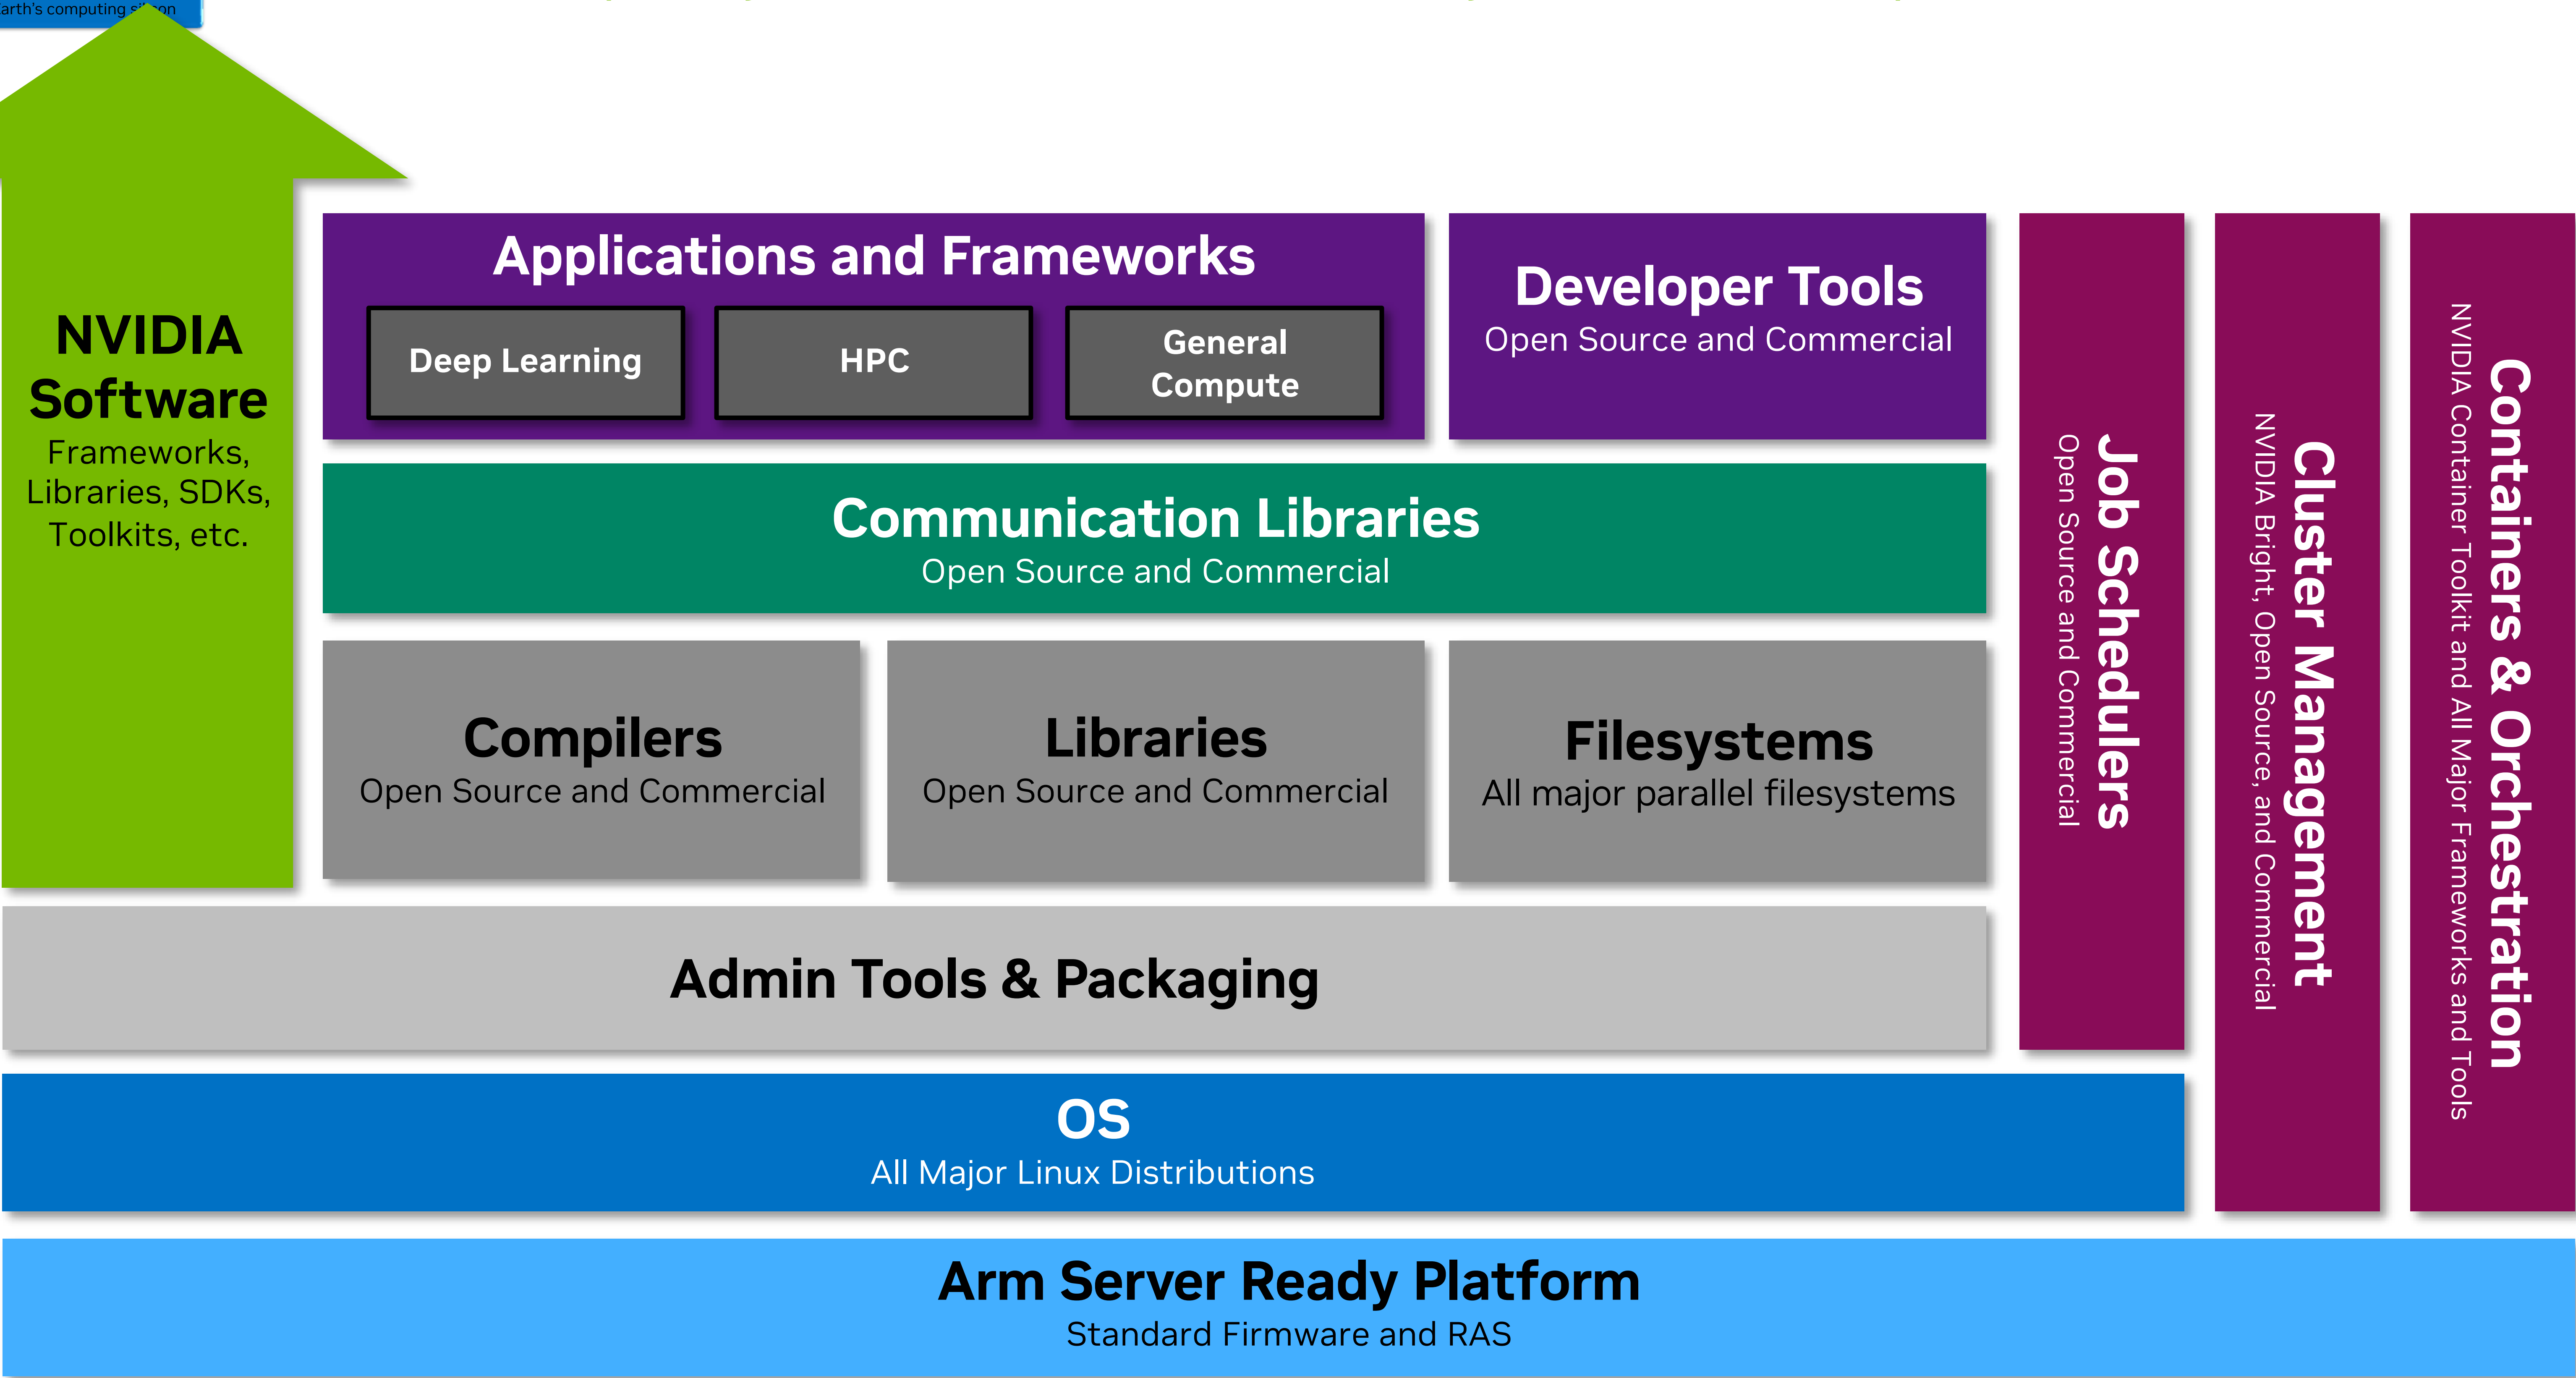

The NVIDIA platform builds on optimized software from the broad Arm software ecosystem

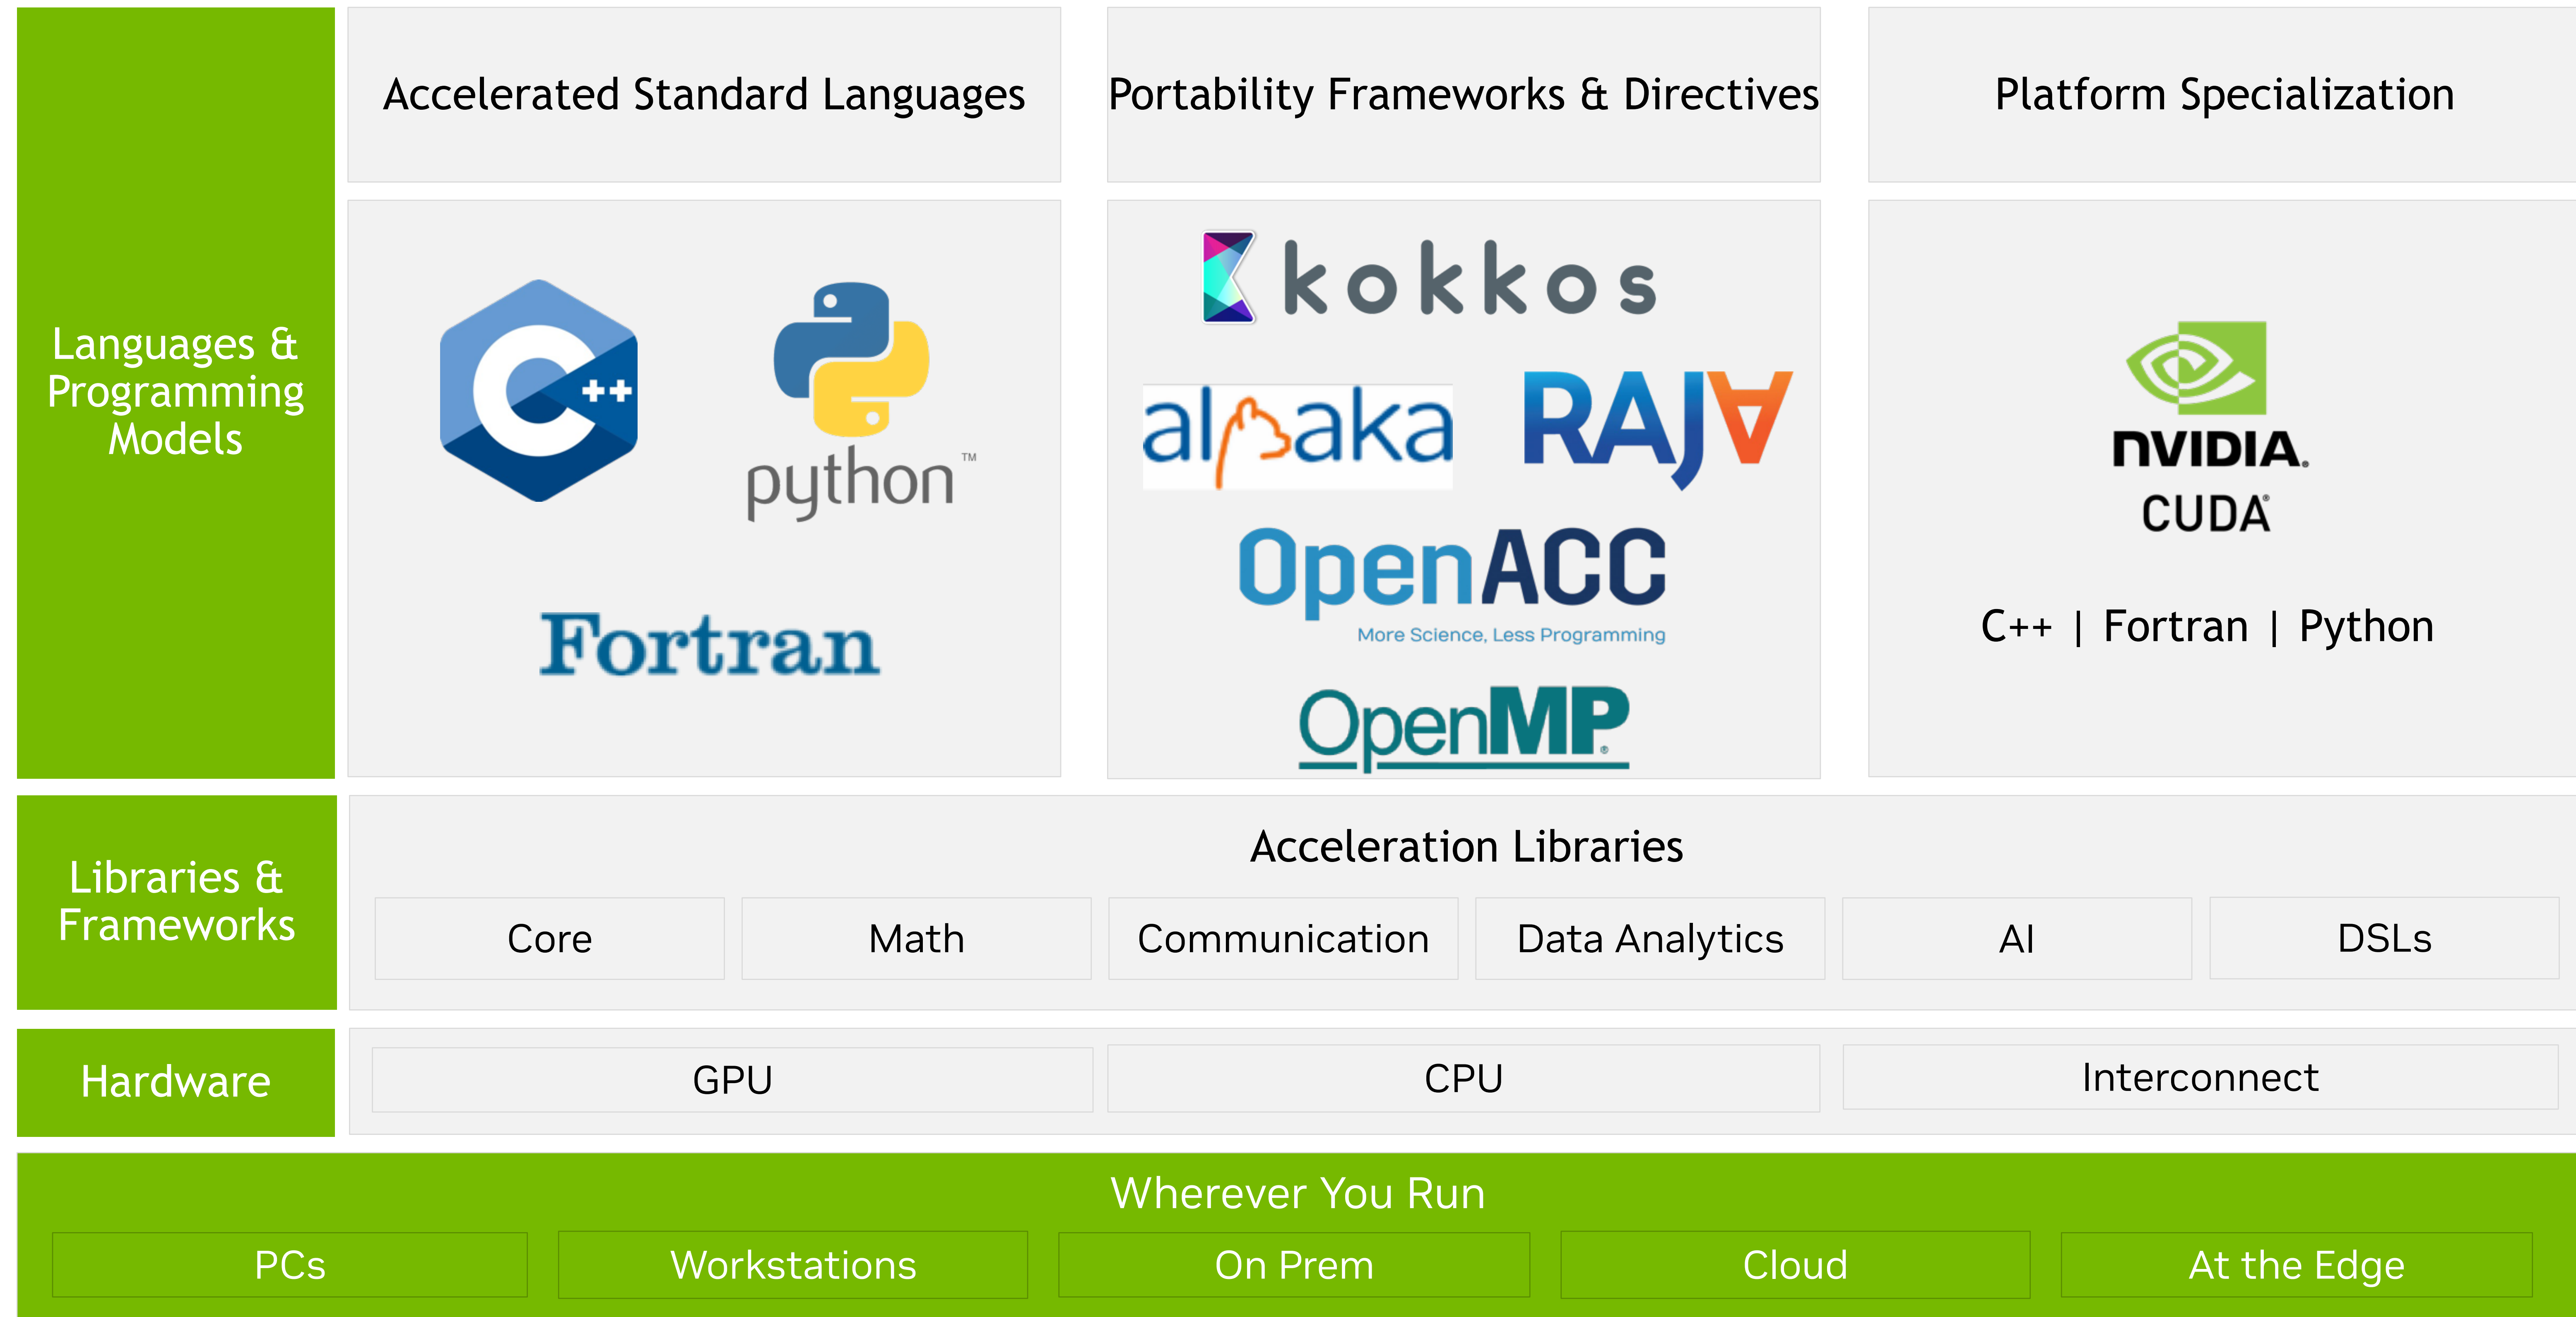

The Arm Software Ecosystem

Developed by NVIDIA, the OSS community, and other Arm partners

Programming the NVIDIA Platform

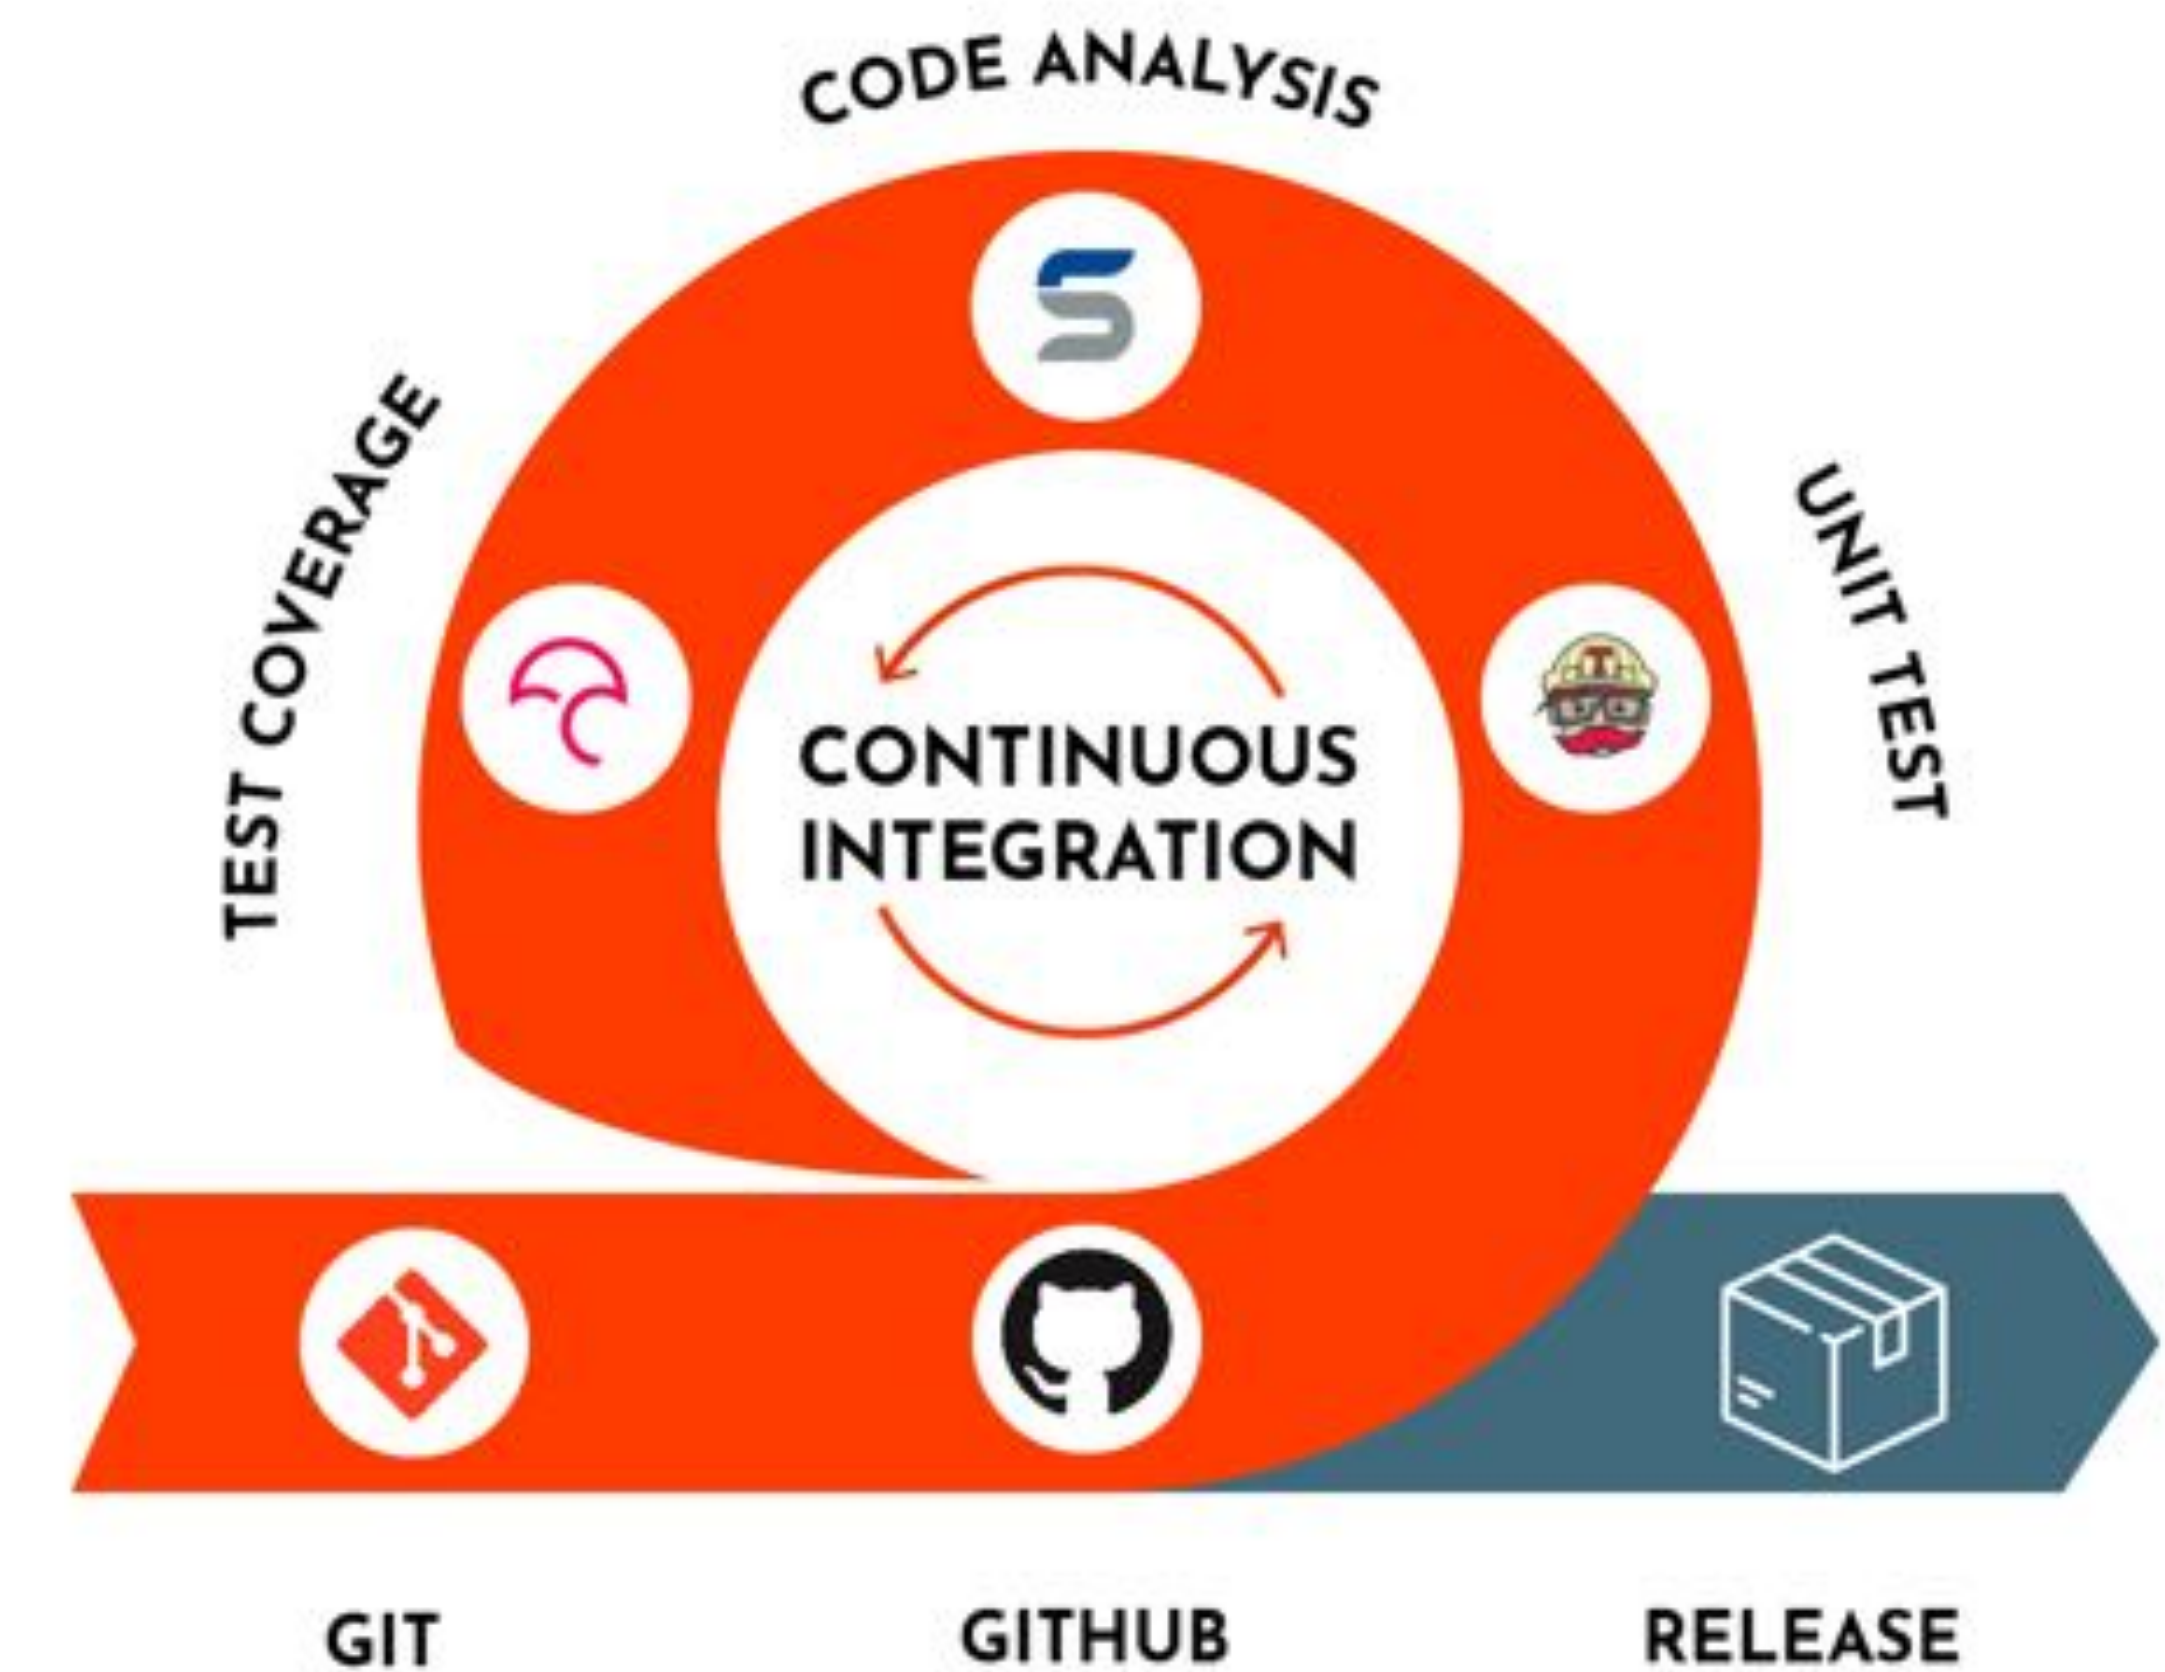

Open Standards Balanced with Platform Specialization

HPC software ecosystem sustainability requires testing the software ecosystem at scale

Infrastructure for automated testing of the diverse hardware and software employed within the HPC enterprise should enhance ecosystem effectiveness.

- HPC users typically compose their software development tool chain from many sources, including DOE, GNU, and Vendor-supplied toolkits.
- NVIDIA maintains infrastructure for the automated testing of NVIDIA's software development kits but does not maintain infrastructure to test with the broad and varied composable HPC ecosystem.
- Ecosystem scale testing and integration services will improve the quality of the composed HPC software ecosystem.
- Large SciComp Centers have a unique opportunity to provide infrastructure and resources for software ecosystem testing.

Benchmarking and Sustainability: Conclusions

1. Benchmarks should be faithful to modern science applications
2. More open benchmark development practices would have many benefits
3. Influence of the benchmark list-makers is large
4. Energy-to-solution is a top-level priority metric moving forward
5. Sustainability in software strategy should include priority investments in ISO language parallelism (C++, Fortran), other *de-facto* standards, modern libraries, etc.
6. Software sustainability requires testing of the full, composed software ecosystem. Infrastructure to accomplish this are limited.
